

It's here! HFX Satin DI

For years PSR-4000 HFX Satin has been used by many around the world; PCB shops, CM's and end users all know it by name. This is not just another DI product, this is HFX DI. There is a difference.

Making a DI version of HFX is not as simple as it sounds. We all know the advantage of DI mask; the ability to have very accurate registration without the use of film. This should result in cost savings due to the reduced film usage in the shop, but more importantly; no more scrap due to mis-registration. The cost of the film is nothing compared to yields. To optimize profits, yields are paramount.

The HFX DI took longer to develop than many other masks, but that's acceptable due to the importance of the finished product. We worked very hard, side by side with a very diligent customer to get it right. The countless hours spent by many, processing panels, taking sections and measurements and counting dams was painful, but necessary. We also accomplished this feat working within the UL guidelines, so using this product will not require further time and money.

It's very important to know that the HFX DI works very well on DI equipment, but did you know it offers an advantage on regular contact exposure equipment? Turns out the HFX DI processes much faster than the standard HFX using your current equipment. So you can buy the new product and produce more boards without making a capital investment, WOW!

You're probably thinking this product is out of your reach, well it's not. To reap all of the benefits of this new mask simply contact your friendly Taiyo America sales representative for more information.
