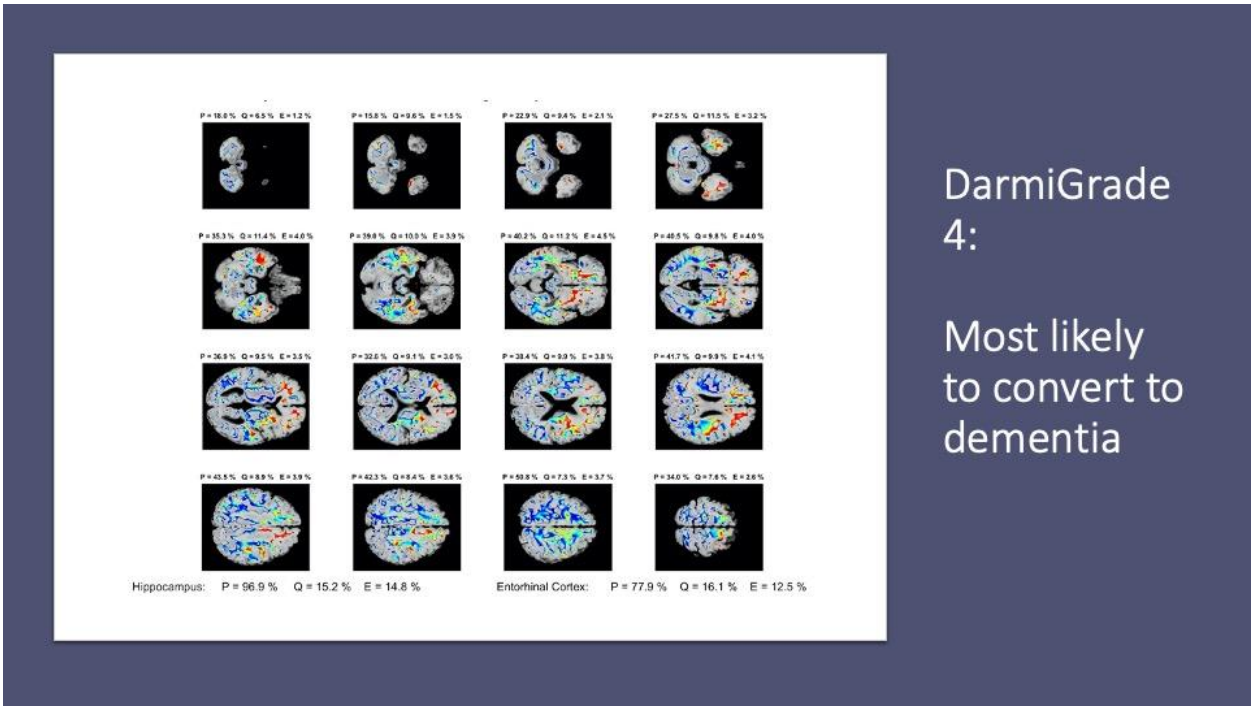
JICYMI in Darmiyan's December summit exhibit the San Francisco-based biotech company debuted its AI/ML-Powered grades for brain health observed by BrainSee, the first third party validated virtual microscope for organ tissue health. Earlier in the fall CABHI innovator Dr. Kaveh Vejdani, who spoke to us in DC last year, presented Darmiyan's highly accurate and consistent results to CTAD - Clinical Trials on Alzheimer's Disease, inspiring scientists from Asia, Europe and the US who were researching breakthrough biomarkers that could finally bring Alzheimer's therapies to market.



Validation investigators say Darmiyan's breakthrough technology will fill a significant diagnostic gap in the clinical field. Fortune featured Darmiyan's CEO Padideh Kamali-Zare as 40 Under 40 for health care leaders this year.

Darmiyan is currently receiving MRI uploads from medical providers, cognitive wellness specialists such as podcaster Nate Bergman, OD, and imaging centers so that BrainSee analysis may be used for research. As Padideh wrote in Psychology Today, we are concerned about the pressures caregivers are under as COVID isolates people; also that the raging infectious disease and Alzheimer's impact Black communities disproportionately. Let's enhance research together.
