

Questions for Senator to Ask FCC

- 1) Why is the FCC overseeing the human exposure limit for wireless radiation when **the FCC is not a health and safety agency** and do not even have a health dept?
- 2) You refer to the FDA for guidance on health but it says very clearly on their website that **by law they are not allowed to test the safety of wireless devices** or cell tower transmitters before they are put on the market. How can you be sure their advice that these new 5G devices and cell transmitters are safe without them safety testing them?
- 3) With the findings of the recent \$25 million US National Toxicology Program Study showing **CLEAR EVIDENCE that wireless radiation can cause Cancer** below our 20 year old thermally based safety guidelines, how do you justify **NOT premarket safety testing or post market surveying these devices and cell tower transmitters to be sure people are not getting cancer or neurological effects from them?**
- 4) With scientific evidence and human reports of wireless radiation causing cancer and neurological disease, **how do you justify continuing to rely on a safety guideline based on suggestions** from largely industry appointed and controlled groups rather than an actual **Safety Standard** developed by an impartial government agency which would ensure that the public's health is being protected? Especially given that the GAO recommended the FCC reassess your safety guidelines more than 5 years ago?
- 5) How do you justify recent FCC **Streamlining Orders which will exempt these new 5G transmitters from Environmental, Health, Safety review** when we have Clear Evidence of biological effects from wireless radiation and individual reports of harm?
- 6) How do you continue to favor wireless systems of communications over wired, fiber optic systems all the way to the home especially for the heavy data transfer needs of 5G when **wireless system have proven over and over again to be impossible to secure and wired Fiber optic systems are up to 10,000 faster?**
