ADA Guide to Reporting D4346

Developed by the ADA, this guide is published to educate dentists and others in the dental community on this scaling procedure and its approved code published in CDT 2017 and effective Jan 1, 2017

Visualizing the decision-making process: How a dentist decides whether or not the D4346 procedure is appropriate for a patient –

Questions and Answers

1. Why was a new “scaling” code added to the CDT Code?

   a) Current CDT codes document procedures for patients with generally healthy periodontium, or patients with periodontal disease that has accompanying loss of attachment (e.g. periodontal pockets and bone loss).

      • D1110 is primarily a preventive procedure, but can be therapeutic depending on the periodontium’s overall health. It is applicable for patients with generally healthy periodontium where any deposits are removed to control irritational factors, and for patients with localized gingivitis to prevent further progression of the disease.

      • Codes D4341 and D4342 are therapeutic procedures, and are indicated for patients who require scaling and root planing due to bone loss and subsequent loss of attachment. Instrumentation of the exposed root surface to remove deposits is an integral part of this procedure.

      • There is no CDT Code available to report therapeutic treatment of patients with generalized moderate to severe gingival inflammation, with or without pseudo-pockets but exhibiting no bone loss – this is the gap filled by D4346.

   b) Filling this gap will result in more accurate documentation and reporting by eliminating consideration of:

      • D4999 as this code requires a narrative containing information that limits auto-adjudication

      • “Undercoding” as a Prophylaxis procedure

      • “Overcoding” as a Scaling and Root Planing procedure
2. Would the D4346 procedure be appropriate for a “hard prophy” where more time than usual is required to remove plaque, calculus and excessive staining from the tooth structures in order to control local irritational factors?

If the “hard prophy” is being defined strictly by the amount of time required to complete the procedure, then no D4346 is not appropriate. The D4346 procedure is applicable when there is generalized moderate or severe gingival inflammation in the absence of attachment loss. In other words, the procedure is based on the diagnosis rather than intensity of treatment required.

3. How do you differentiate this new scaling procedure (D4346) from the current debridement procedure (D4355)?

D4355 is an enabler for comprehensive oral evaluation i.e. it is performed before the subsequent comprehensive evaluation simply to remove gross deposits from the tooth surface. D4346 is a therapeutic service performed after evaluation and diagnosis of gingivitis to remove all deposits and allow tissue healing.

4. What sort of oral evaluation is appropriate before delivery of D4346?

As with all therapeutic procedures, D4346 is performed after a periodic (D0120), comprehensive (D0150), or comprehensive periodontal (D0180) oral evaluation.

5. May the oral evaluation and the D4346 procedure be performed on the same date of service?

Yes. There is nothing in either CDT Code’s nomenclature or descriptor that precludes their delivery and reporting on the same date of service.

6. What is the clear and accepted definition of “…generalized moderate to severe gingival inflammation…” so that the D4346 procedure can be differentiated from prophylaxis procedures?

a) The AAP defines generalized chronic periodontitis to be when 30% or more of the patient's teeth at one or more sites are involved, and it is reasonable to extend this definition to a patient with gingivitis.

b) The Gingival Index of Löe and Silness defines gingival inflammation as follows:

0 = normal gingiva
1 = mild inflammation- slight change in color and slight edema but no bleeding on probing
2 = moderate inflammation- redness, edema, and glazing, bleeding on probing
3 = severe inflammation- marked redness and edema, ulceration with tendency to spontaneous bleeding.

7. What procedure is appropriate for patients with localized gingival inflammation (gingivitis)?

D1110 is applicable for patients with localized gingivitis to prevent further progression of the disease.

8. Is there a waiting period between completion of a D4346 and delivery of a prophylaxis as part of the patient’s routine preventive regimen?

There is no set waiting period. D4346 is a therapeutic procedure to bring the patients periodontium back to health. Based on the patients’ needs, the dentist is in the best position to determine when the patient can assume a regular preventive regimen that includes oral prophylaxis.
9. **D4346 is a full mouth procedure; does this mean that it is completed in a single day?**

   This procedure is expected to be completed on a single date of service, but patient comfort and acceptance may require delivery over more than one visit. Should more than one day be required the date of completion is the date of service.

10. **What dental professional would deliver the D4346 procedure?**

   As with all procedures documented with CDT codes, state laws regulating scope of practice determine which persons may deliver the service.

11. **Is local anesthesia used when delivering D4346?**

   Patient needs and preferences, as well as the clinical state of the dentition, are factors that the dentist considers when determining the need for local anesthesia. State law determines who may deliver the anesthetic agent, which would be documented on the patient’s record using the applicable CDT Code.

12. **What should be documented in the patient’s record to support delivery of D4346?**

   a) Periodontal charting that records (pseudo) pocket depths and bleeding on probing. (Note: Pocket depth may be recorded without loss of attachment.)

   b) Diagnostic images (type and frequency to be determined by the dentist) may be helpful to document the gingiva’s condition (e.g., visualize localized v. generalized inflammation) for retention in the patient’s chart.

13. **Is D4346 a procedure followed by periodontal maintenance reported with D4910?**

   No. D4346 is performed in patients who do not exhibit any loss of attachment. D4910 is a procedure that includes site specific root planing as needed in patients who have been treated for attachment loss.

15. **There is another new entry in CDT 2017 – “D6081 scaling and debridement in the presence of inflammation or mucositis of a single implant, including cleaning of the implant surfaces, without flap.” This procedure could be part of the treatment plan for a patient who also has moderate to severe gingival inflammation. Could D6081 and D4346 be delivered to the patient on the same date of service?**

   Yes. Both D6081 and D4346 may be delivered on the same date of service as there is nothing in either CDT Code’s nomenclature or descriptor that precludes concurrent delivery and reporting.

   Please note, however, that the D6081 descriptor includes exclusion language stating – “This procedure is not performed in conjunction with D1110 or D4910.” – meaning that these are considered separate procedures and may be reported with the same date of service.

16. **What do you mean by “Loss of attachment”?**

   This term is defined (Stedman’s Medical Dictionary for Dental Professionals; 1st Edition, 2007) as: “Damage to the structures that support the tooth; results from periodontitis and is characterized by relocation of the junctional epithelium to the tooth root, destruction of the fibers of the gingiva, destruction of the periodontal ligament fibers, and loss of alveolar bone support from around the tooth.” (see illustration). **Loss of attachment results from loss of bone.**
17. Why was the procedure for “scaling in the presence of...generalized gingival inflammation” assigned a code in the CDT Code’s “D4xxx” (Periodontics) category rather than in “D1xxx (Preventive)?

The procedure is considered therapeutic for a patient in a diseased state, as noted by the following sentence in the D4346 descriptor – “It is indicated for patients who have swollen, inflamed gingiva, generalized suprabony pockets, and moderate to severe bleeding on probing.” When a patient is diagnosed with generalized gingivitis following an oral evaluation this scaling procedure treats the generalized gingival inflammation and pseudopockets present.

18. Can a patient who received the D4346 scaling procedure then receive a D4341 (or D4342) scaling and root planing procedure?

There is no exclusionary language in the nomenclatures or descriptors of D4346, D4341 or D4342, as dentists recognize that periodontal disease may be progressive. The CDT Code fully supports documentation and reporting of procedures at any time the dentist determines they are necessary for the patient’s oral health. This is a matter of clinical judgment by the treating dentist. Benefit design should not guide the clinical determination of procedure performed. For example:

1 **Scenario 1:** A patient presents and after an oral evaluation the dentist determines that there is generalized moderate to severe gingival inflammation without attachment or bone loss. The treatment plan based on this evaluation is delivery of D4346. When completed the patient receives oral hygiene instruction that when followed would reduce the likelihood of continued or recurring inflammation.

On a later date the same patient presents, complaining of bleeding gums or at the next scheduled oral evaluation, the dentist notices that the patient now has periodontitis with attachment and bone loss. In this event a new treatment plan is prepared that includes scaling and root planing procedures (e.g., D4341 or D4342). For this recurrent episode of disease scaling (D4346) is not repeated prior to SRP because the patient has bone loss.

2 **Scenario 2:** A patient presents and is diagnosed with localized or generalized periodontitis with evidence of bone loss. The treatment plan based on this evaluation is scaling and root planing (D4341 or D4342). Any subsequent treatment would be either periodontal maintenance (D4910) or repeating the SRP treatment. The D4346 procedure is not applicable as part of initial or subsequent treatment in this scenario because the patient exhibits bone loss, and "scaling" is an inherent component of the SRP procedure.

The following chart illustrates these and other clinical scenarios.

<table>
<thead>
<tr>
<th>Findings upon evaluation</th>
<th>Attachment/Bone</th>
<th>Treatment rendered/ planned</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generally healthy, if present</td>
<td>Healthy - No attachment or bone loss</td>
<td>D1110</td>
</tr>
<tr>
<td>localized gingival inflammation</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Generalized moderate to severe gingivitis</td>
<td>Healthy - No attachment or bone loss¹</td>
<td>D4346 (No D1110)</td>
</tr>
<tr>
<td>Localized gingivitis</td>
<td>Localized bone loss²</td>
<td>D1110 + SRP as applicable (D4341, D4342) + other treatment as needed*</td>
</tr>
<tr>
<td>Generalized gingivitis</td>
<td>Localized or generalized bone loss²</td>
<td>D1110 + SRP as applicable (D4341, D4342) + other treatment as needed*</td>
</tr>
</tbody>
</table>

¹Note: This guide does not address other treatments for periodontitis (e.g. osseous surgery, bone graft etc.) that may be planned to treat the disease.
19. If one quadrant of scaling and root planing is performed because there is bone loss only in that quadrant, can you report 4346 for the rest of the mouth on the same date of service?

According to the D4346 descriptor this procedure “…Should not be reported in conjunction with prophylaxis, scaling and root planing [emphasis added] or debridement procedures.” In an exceptional situation the dentist could submit a claim for both services with an explanatory narrative. This would not necessarily result in reimbursement for the separate scaling procedure.

20. What would be an appropriate fee for the D4346 procedure – something between a prophylaxis fee and a scaling and root planing fee?

Each dentist who decides to deliver the D4346 procedure would set an appropriate fee, which may be adjusted with experience. One dentist might consider a value between a D1110 and a D4341, while another may not. This is each dentist’s business decision.

There is no claim history for the D4346 procedure, or fee survey information. Dental benefit plan designers and administrators are in a similar situation regarding reimbursement amounts and frequency. It will likely be some time before aggregate fee or reimbursement information will be available.

21. Are there any frequency limitations on the scaling procedure?

Patient needs differ and the dentist’s clinical evaluation determines when the D4346 procedure is indicated to maintain oral health. Dental benefit plans may, however, have coverage limitations or exclusions that may limit available reimbursements. It is important that the patient understand that not all procedures needed to maintain oral health or address dental disease are covered by dental benefit plans.

22. How often will a dental benefit plan provide coverage and reimbursement for the D4346 procedure?

The CDT Code provides a means to document and report services rendered. Reimbursement as with all codes is determined by provisions of the patient’s dental benefits plan. The patients dental plan determines coverage and defines which services are covered as well as limitations and exclusions, which may vary, based on regulatory requirements and/or the level of coverage.

It is likely that coverage limitations and reimbursement amounts will vary between dental benefit plans as such matters are often determined through actuarial experience. It is also likely that payers will take into account the rate of progression of periodontal disease when determining a frequency limitation to the D4346 and follow-up D4341/D4342 procedures. The best way to know is to ask the carrier (e.g., submit a pre-determination request).

23. If radiographs on the date of service are not required as part of the D4346 procedure, what about periodontal charting – considering both patient record-keeping and claim submission?

From the record keeping perspective the patient’s record should contain necessary radiographs and charting within the last year to document the state of inflammation, pocketing and loss of attachment or bone. Photographs taken on the date of service are also helpful for visual documentation. Any patient who shows sign of disease should have an up to date chart and images in their record. The American Academy of Periodontology (AAP) recommends annual charting.

24. Patients with full mouth implant supported prostheses without any natural teeth have abutments and prostheses that need to be cleaned regularly. Because the D4346 CDT Code entry does not specify the type of tooth involved – natural or prosthetic – is it appropriate to use this code for such regular cleaning?

The D4346 procedure is applicable to natural teeth as it’s descriptor describes the procedure as “…removal of plaque, calculus and stains from supra- and sub-gingival tooth surfaces [emphasis added]…” According to the D6080 nomenclature that procedure applies to implants.

## Clinical Scenarios

1. **Illustrations of situations where gross debridement may be applicable**

   **D4355 full mouth debridement to enable comprehensive evaluation and diagnosis**

   The gross removal of plaque and calculus that interfere with the ability of the dentist to perform a comprehensive oral evaluation. This preliminary procedure does not preclude the need for additional procedures.

   Note the generalized nature of deposits. Periodontal probing and charting may be difficult in such a case, and debridement could facilitate the comprehensive oral evaluation.
2. Illustrations of situations where oral prophylaxis may be applicable

D1110 prophylaxis – adult

Removal of plaque, calculus and stains from the tooth structures in the permanent and transitional dentition. It is intended to control local irritational factors.

D1120 prophylaxis – child

Removal of plaque, calculus and stains from the tooth structures in the primary and transitional dentition. It is intended to control local irritational factors.

a) Note localized inflammation. Generally healthy periodontium with no loss of attachment.

b) Note stains and some supragingival deposits and localized inflammation but there is no bone loss.
3. Illustrations of situation where scaling may be applicable

**D4346 scaling in presence of generalized moderate or severe gingival inflammation – full mouth, after oral evaluation**

The removal of plaque, calculus and stains from supra- and sub-gingival tooth surfaces when there is generalized moderate or severe gingival inflammation in the absence of periodontitis. It is indicated for patients who have swollen, inflamed gingiva, generalized suprabony pockets, and moderate to severe bleeding on probing. Should not be reported in conjunction with prophylaxis, scaling and root planing, or debridement procedures.

Note generalized inflammation with some pseudo-pockets. No apparent attachment loss.

4. Illustrations of situations for SRP and future periodontal maintenance

**D4341 periodontal scaling and root planing – four or more teeth per quadrant**

This procedure involves instrumentation of the crown and root surfaces of the teeth to remove plaque and calculus from these surfaces. It is indicated for patients with periodontal disease and is therapeutic, not prophylactic, in nature. Root planing is the definitive procedure designed for the removal of cementum and dentin that is rough, and/or permeated by calculus or contaminated with toxins or microorganisms. Some soft tissue removal occurs. This procedure may be used as a definitive treatment in some stages of periodontal disease and/or as a part of pre-surgical procedures in others.

**D4342 periodontal scaling and root planing – one to three teeth per quadrant**

This procedure involves instrumentation of the crown and root surfaces of the teeth to remove plaque and calculus from these surfaces. It is indicated for patients with periodontal disease and is therapeutic, not prophylactic, in nature. Root planing is the definitive procedure designed for the removal of cementum and dentin that is rough, and/or permeated by calculus or contaminated with toxins or microorganisms. Some
soft tissue removal occurs. This procedure may be used as a definitive treatment in some stages of periodontal disease and/or as a part of pre-surgical procedures in others.

**D4910 periodontal maintenance**

This procedure is instituted following periodontal therapy and continues at varying intervals, determined by the clinical evaluation of the dentist, for the life of the dentition or any implant replacements. It includes removal of the bacterial plaque and calculus from supragingival and subgingival regions, site specific scaling and root planing where indicated, and polishing the teeth. If new or recurring periodontal disease appears, additional diagnostic and treatment procedures must be considered.

a) Photographic evidence of generalized attachment loss

b) Radiographic evidence of bone loss
c) Periodontal chart recording pocketing, attachment loss and bone loss
