

## **NR 151 Silurian Bedrock Sub-Committee**

- **Manure may not be mechanically applied on croplands or pastures until infield bedrock verification or Silurian bedrock map information is used to identify areas where Silurian bedrock soil depth is less than 5 feet.**
- **At this time there is no standard method of properly and reliably verifying the depth bedrock maps produced.**
- **The WAPAC Research Committee would like to bring together a group of private consultants to develop a standard protocol to use non invasive geophysical equipment to verify depth to bedrock. Once this protocol is developed, then test the protocol on a representative set of fields to determine the soundness of the protocol.**
