

## Push Patch the Industry's Strongest Prescription-Only Iontophoresis Peptide Patches

Thank you for your interest in Push Patch and our innovative peptide delivery solutions. As a fellow clinician, my primary objective has always been to provide patients with the best products at affordable prices, empowering their bodies to heal naturally. I am excited to share how our Push Patch iontophoresis technology can transform peptide therapy in your practice.

### What is Iontophoresis?

Iontophoresis is a proven drug delivery technology that dates back to the mid-18th century. Think of it as an "IV without a needle." By using a mild electric current, iontophoresis enables molecules to penetrate the skin and enter the bloodstream. With modern advances in microprocessor technology, our Push Patch units are now wireless, easy to apply, and convenient for patients to wear.

### Advantages of Iontophoresis

In addition to providing a needle-free, painless method of delivering molecules directly to the bloodstream, iontophoresis offers several clinical advantages:

- **Avoids the GI Tract:** By bypassing the gastrointestinal system, iontophoresis ensures that peptides remain effective, avoiding the degradation that often makes oral administration less ideal.
- **Extended Release for Enhanced Efficacy:** Perhaps the most significant benefit of iontophoresis is its ability to release molecules gradually into the bloodstream. For peptides like BPC157, which has a half-life of only 30 minutes, this slow release means a prolonged therapeutic effect. While a single injection would quickly taper off, our patches provide a steady release over 12 hours, leading to superior clinical outcomes.

### Comparative Example

Consider the difference in dose effect between IV therapy and our Push Patch:

- **IV NAD+ (500 mg):** Peaks quickly, but after 6 hours, less than 16 mg remains.
- **Push Patch NAD+ (1300 mg):** Delivers a consistent 108 mg per hour over 12 hours, ensuring a sustained presence in the bloodstream and maximizing clinical benefits.

Our iontophoresis technology clearly demonstrates the advantage of controlled, slow-release therapy for molecules like BPC157, NAD+, GHK-Cu and KPV—molecules that would otherwise require multiple daily injections to achieve similar effects.

### Customizable Options for Your Patients

At Push Patch, we understand that every patient is unique, and we offer tailored options to meet their needs:

- **Standard Patch:** With a 14-hour delivery window, our standard patch is ideal for those with sensitive or dry skin. It has a milder adhesive, making it suitable for those who may experience skin sensitivity.
- **Sports Patch:** Designed for active patients, the sports patch provides a secure grip even during rigorous activities, ensuring the patch stays in place throughout exercise or sports events. It offers a 12-hour delivery window.

### **Physicians Only**

At Push Patch we only sell to physicians not consumers “your patients”. Our Iontophoresis patches are considered medical devices that can only be prescribed by Medical Doctors, Chiropractors, Physical Therapist, Nurse Practitioners, Physician Assistants and Podiatrists.

### **Commitment to Quality**

Push Patch ensures the highest product integrity by shipping peptides in powder form. This prevents degradation and guarantees potency, unlike liquid peptides, which can lose efficacy in as little as 30 days. Each peptide is produced in our GMP-certified lab, with third-party testing available upon request to verify strength, purity, and sterility.

**If you treat personal injury patients in your practice, ask us how our products can be billed for TBI/concussion cases and pain management in auto accident cases.**

**We also offer a comprehensive line of injectable peptides**, including BPC157, TB500, NAD+, Glutathione, GHK-Cu, CJC1295/Ipamorelin and GLP-1's—all manufactured in-house to the highest standards. If you are interested, ask for a product list from our sister company **Pinnacle Biolab**.

Please find our product list and pricing attached. If you have any questions or need further information, I would be delighted to assist. I look forward to helping you provide exceptional care to your patients with Push Patch.

Warm regards,  
Dr. Buzz Korth DC, ABAAHP, FSCT, FAAMFM

### Sample Protocols

These are sample protocols and are not meant to be recommendations.

#### NAD+ 1300 mg

##### **Anti-Aging/Increased performance**

- Loading phase wear one patch a day for 3 days in a row.
- Wear patches weekly or bi weekly.

##### **Traumatic Brain Injury “acute”**

- Wear patches “at least” 3 days per week until symptoms resolve.

##### **Traumatic Brain Injury “chronic”**

- Loading phase wear one patch a day for 3 days in a row.
- Wear patches weekly or bi weekly.

##### **Addiction**

- Loading phase wear one patch a day for 3 days in a row.
- Wear one to two patches per week based upon craving reduction.

#### BPC157 2000mcg + NAD+ 250 mg

##### **Acute pain/Injury/Post surgery**

- Wear patches daily until pain has decreased 50%.
- Wear 2 to 3 patches per week until pain has resolved.

##### **Gut Health**

- Wear 2 patches in a row and then every other day until symptoms resolve.
- Maintenance wear one to two patches a week.

##### **Anti-Aging/Increased performance**

- Wear one to two patches per week, typically after intense training days.

**Mention Breakthrough Coaching for Free Shipping.**

**KPV 10mg + NAD+ 500 mg**

---

**Acute systemic inflammation / autoimmune**

- Wear patches daily for 3 consecutive days to mitigate acute symptoms.
- Wear 1 to 2 patches per week for the remainder of the month.
