

Extraction Cleaning

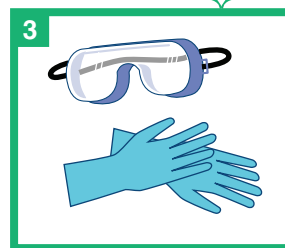

Provided by:

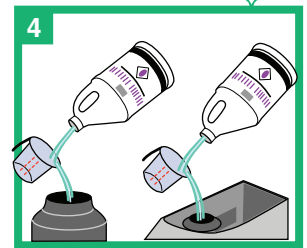

Gather equipment.

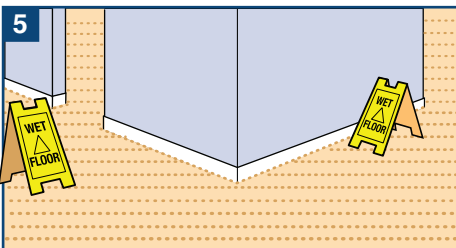

Vacuum area thoroughly.

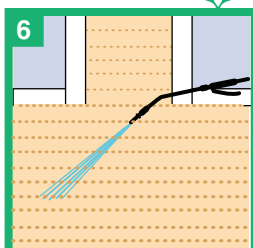

Wear proper personal protective equipment.

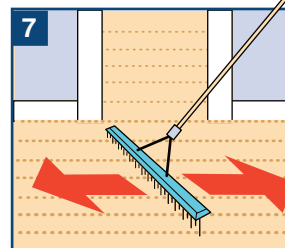

Properly mix prespray and extraction cleaner in appropriate container or machine.

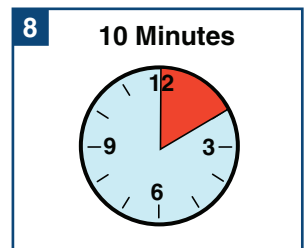

Place wet floor signs at all entranceways.

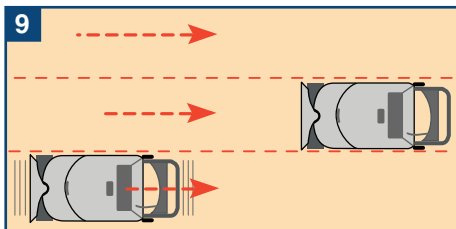

Spray carpet with a prespray solution using a pressure sprayer.

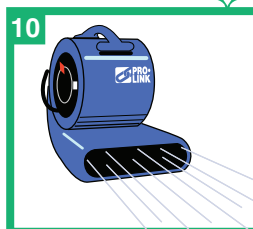

Use a carpet rake in heavily soiled areas.

Allow 10 minutes dwell time before extracting.

Use the double pass method with the extractor and overlap passes. Use a rinse if necessary.

Allow appropriate dry time before traffic.

 = Green Cleaning Process

Green Cleaning Tips

- Notify occupants when carpets are to be extracted as this activity can affect more sensitive individuals.
- When prespraying, solution should be applied from a sprayer in a stream or a course spray, as compared to a fine mist.
- Minimize the amount of cleaning chemical used by properly diluting the product.
- Use the least amount of water possible.
- Equipment should be fully functional to minimize moisture and potential for mold and mildew.
- Increase ventilation where possible. Carpets should be completely dry within 24 hours.
