

Construction Services ~

The task with this article is to discuss a project that took place over several years. The project that comes to mind for me is the Heritage Lake Spillway.

When I was first hired at Banning Engineering, I was a rodman for our survey group. The Heritage Lake Spillway was a site we surveyed every couple of years. The spillway was in need of repair and our surveys would track how much the concrete would heave or sink throughout the years.

As the years passed, I moved into my current role as Construction Services Manager. Joe Miller approached me to help him with anew design for the spillway. I was excited because I have a history installing concrete and I have a survey history with the spillway itself.

Fast forward to the removal and construction of the spillway where I served as the construction inspector. I enjoyed helping the contractors solve field issues weekly if not daily. I believe that being able to take part in a project as it evolves is how we were able to deliver a successful finished product.

Our work with the spillway continues; currently I am helping the owners of the spillway with the maintenance plan that we created for them. This project throughout the years went from survey, design, construction, and maintenance. We can do it all. If you have a project that needs taken from beginning to end or just need our services for construction observation, please contact me: Mike McCrary at mmccrary@banning-eng.com or 317-707-3700.
