

Spring Gravel Inventory: A Smart Move for Rural Municipalities

1. Plan for the Season Ahead

A precise measurement of your current inventory lets your team plan upcoming roadwork and gravel programs with confidence. You'll know what you have, where it is, and how much more you'll need.

2. Support Transparent Contracting

Whether you're contracting for crushing, hauling, or both — having accurate baseline measurements helps prevent billing disputes and ensures contractors are working from the same numbers as your RM.

As a **SARM-approved vendor**, Zach James Media is already set up to work with your RM. Our gravel inventory service is available through your existing SARM procurement channels—making the process simple, streamlined, and backed by an organization you trust.

Why Measure in the Spring?

For rural municipalities across Saskatchewan, gravel is one of the most valuable and heavily used resources. It's essential for road maintenance, infrastructure projects, and emergency access. As the snow melts and the ground firms up, early spring is the ideal time to take stock of your gravel inventory—**before hauling or crushing contracts begin.**
