

[GRIP Idle Management](#) -- with headquarters in Ancaster, Ontario, Canada – became a Drive Clean Indiana member in 2020.

The GRIP Idle Management System, developed in 2009, is a response to a growing number of customer requests to reduce fuel consumption and harmful emissions. On its third rendition, the new GRIP system has been developed to respond to new vehicle technologies, providing a more flexible, adaptable product. The GRIP System collects vital data unavailable through typical vehicle operation and telematics. The information recorded has never been recognized in fleet utilization studies, including the amount of idling contributing to keeping the operators safe and in a comfortable, climate-controlled environment, all of which transfer into real costs.

Unmatched in its ease of use for operators, product support and advanced technologies that work seamlessly with everyday vehicles, the GRIP Idle Management System is a market leader, setting the standard for idle management technology. GRIP Idle Management is proud to be working partners with world-class equipment manufacturers and technology providers who also recognize the quality and advanced technology of the GRIP System. As a company, GRIP Idle Management is proud to develop, produce and support products that provide a positive impact on our planet and reduce our reliance on fossil fuels. GRIP Idle Management's team is passionate about its products, which motivates them to improve continually, sharing idle reduction success with their loyal, beloved customers.
