

## New Internal Funding Opportunity for Students

Boca Raton, Fla. (April 13, 2018) – Through the Division of Research, the institute has launched a funding program to support collaborative student research projects. We sought proposals from student teams to engage in multidisciplinary efforts that have the potential for significant societal impact. Submissions are being reviewed. The demonstration of a well-documented application, system or device prototype that has the potential to significantly benefit society will be the most important outcome of a successful project.

Selected teams will receive up to \$1,500 for materials, supplies, software license and other services to support their projects. Successful teams will conduct their projects in the Sensing and Smart Systems Innovation Laboratory and have access to all available facilities. Mentoring and engineering support will also be provided through I-SENSE.
