

DT CONNECT UPGRADES THAT WILL TRANSFORM YOUR INSPECTION PROCESS

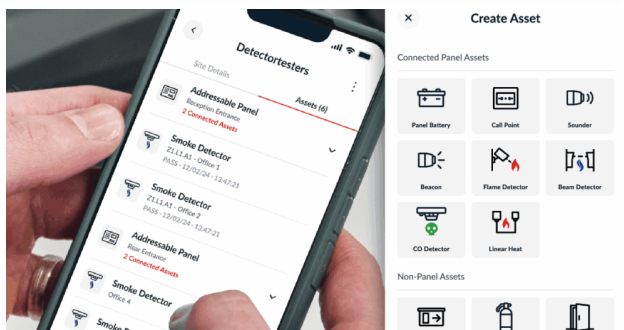

DT Connect has rolled out a suite of powerful new features designed specifically for test and inspection professionals. These enhancements are built to improve accuracy, speed up workflows, and offer greater control over asset and site data. Here's a closer look at what's new—and how it can elevate your inspection processes.

Complete Asset Management

Managing assets is now more streamlined and complete. You can now add additional asset types—including Pull Stations, Horns, Bells, Chimes, AVs, Stobes, and Speakers—ensuring your reports represent a full picture of all fire and safety components.

Key capabilities include:

- Create, Edit, and Delete Assets: Enter asset details individually with full flexibility.
- Bulk Import Asset Lists: Save time by importing asset data from spreadsheets or other software.
- Transfer Assets from Reports to Site Lists: If an inspection was completed before the site was set up in the system, you can now transfer recorded assets from the report directly into the Site Asset List for future use.

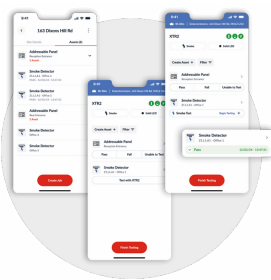

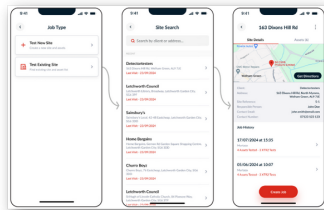

Why it Matters for Inspection Professionals

These updates are designed to save you time, reduce duplication of effort, and improve the reliability of your records. Whether you're managing hundreds of assets or conducting routine follow-ups, DT Connect now gives you a smarter, faster way to get the job done—with confidence and precision. If you haven't explored these new features yet, now's the time. [Visit sdifire.com/dtconnect](https://www.sdifire.com/dtconnect)

Faster Testing with Existing Site Data

When revisiting a site, there's no need to start from scratch. DT Connect provides access to the complete site history, including previous reports and saved asset lists, significantly reducing setup time and improving the accuracy of follow-up inspections. From the Site Page, users can view historical data and completed jobs, reuse existing site and asset information to quickly begin new tests, and maintain consistency across visits to support compliance and detailed reporting.

Optimized Testing Workflow

DT Connect's streamlined workflow improves how you test assets using the XTR2. When selecting a saved asset, the app automatically recognizes the required test type and communicates with the XTR2 to configure itself accordingly. Once the test begins, any results captured are linked directly to the selected asset—eliminating manual input and minimizing errors.

Improved Site Overview and Job Summary

Navigating between jobs and sites has never been easier. The updated interface offers a centralized view of your operations, helping you plan and act faster.

Highlights include:

- New Sites Tab
- Filtering Options
- Detailed Site Page
- Job Reports Summary

Updated, Professional Reports

DT Connect now auto-generates polished, PDF-format reports that include:

- Digital signatures for authentication
- Full test result breakdowns
- Easy sharing and archiving options

These reports not only support compliance but also improve transparency with clients.
