Exit Stage Left - Demolition Forthcoming at Robert Frost Auditorium

With the Summer projects coming to a close, the focus has shifted to the upgrade of the historical Robert Frost Auditorium at Culver City High School. Built back in 1964, this building was constructed with a four inch thick reinforced concrete roof that rests atop a circular brick masonry structure that is tied together with a glass curtain wall. Notated by the Culver City Historical Society as, "one of the best designed modern structures", which still holds true to today as the auditorium has survived several major earthquakes and remains an integral part of Culver City High School's Drama and Arts Program.

We are excited to get started with the renovation which will include a completely new HVAC system, a new black box stage, and the installation of a new custom built-up steel plate arch that will span over the stage area and support the new catwalk system as well as the improved stage lighting. The exterior structure will remain intact, but the project will kick off with the demolition of the interior spaces in order to accommodate the new interior design.
