Agricultural Medicine: Occupational and Environmental Safety and Health for Agricultural and Rural Populations. This book offers an up-to-date, science-based comprehensive treatise of occupational and environmental injuries and illnesses of workers in production agriculture, their treatment and prevention. It includes the importance of production in the global economy, the demographics of the workforce, regulations, statistics, and organizations focusing on agricultural safety and health. Specifically, it covers topics of infectious diseases, toxic agents, and injuries among others to which agricultural populations are exposed daily.

New to the 3rd edition are specific hazards presented by global climate change, mental health issues, and emerging hazards. The book presents a roadmap to establish sustainable workers and public health support for rural and agricultural communities.

This essential "one health" book will be of interest to students, physicians, nurses, other midlevel providers, and EMT's that provide clinical services to rural areas. Further it is of interest to professionals in occupational safety and health, safety engineers, epidemiologists, public health practitioners, researchers, educators, psychologists, and rural veterinarians. Its appeal will extend to those in the industry of processing agricultural products.
