

The Living In Place Institute

The focus of the Living In Place Institute is education and awareness to the housing, medical, and all related industries to improve safety, health, and comfort in all homes for persons of all needs and ages. This is accomplished by helping professionals:

Learn how to recognize the need to improve designs and products. Through the process of interdisciplinary advanced education, professionals are now able to recognize specific areas and items for improvement in homes, and readily recall and recommended solutions.

Understand professional responsibilities to interpret the necessity for change by exemplifying and classifying needs. They are then able to summarize solutions, suggesting positive outcomes by comparing past and new ideas. They are specifically trained how to best explain to their respective constituents their proposed work and how to secure approval for change.

Apply experience, new knowledge, and skills to execute change by implementing a team collaboration focused on improving all homes.

Analyze different viewpoints and organize as solutions for all home environments.

Evaluate the need for home changes through analytic research of current home conditions. Through use of an electronic assessment tool, trained graduates are now able to evaluate planned and current homes for recommended changes and provide a custom report quickly and efficiently.

Create business opportunities that allow and foster planning, selling, and producing the changes necessary in all homes to achieve the focus of All Homes Safe – Health – Comfortable.

The Living In Place Institute provides advanced education and awareness programs creating a global network that: 1. Meets the business needs of the design and medical professionals who work with each other and directly for their end clients, 2. Encourage the continuing development and supply of products, as well as providing invaluable access to support services to other participating professionals and the end client, and, 3. Provide practical application education to professionals who work in homes installing designs, products, and services recommended by other members of the network.
