

Did you know that there is an alternative to messy grease guns and lube packs? Gear Head has revolutionized fifth wheel lubrication by creating soy-based grease pads that offer easy and clean application in an environmentally sustainable product. Not only do these grease pads eliminate the waste of plastic lube packs, they also help to support American Farmers by providing another market for soybeans.

To use these grease pads all you need to do is place 2 pads on the fifth wheel coupling! Gear head has encased the grease in a high-melt wax coating that quickly releases the grease when the fifth wheel is attached to the trailer. Regular turning motions spread the grease over the fifth wheel to provide full coverage and eliminate grease loss caused when plastic grease packages burst. Not only do these grease pads provide ease of application, but each pad also contains a high-performance grease that outperforms the best petroleum based fifth wheel lubrication products.

Check out the ease of application in this quick video:

If you are interested in trying these grease pads yourself please contact Hanna Campbell at the Michigan Soybean Committee by emailing Hcampbell@Michigansoybean.org for a free sample! To receive samples truckers and companies must be willing to provide feedback about their Gear Head soy-based lube pad experience.
