

South Coast Company Saving Infected Word Press Websites

New chamber member [WP Managed Secure](#) is providing the most complete package available for WordPress management, with lightning-fast hosting and trusted security protection service.

"There is an ever-increasing threat of WordPress websites becoming compromised because of a lack of proper security," said Jack Voorheis, WP Managed Secure founder. "As a result of malicious hacking activity, innocent business website owners often face their websites being blacklisted by Google, Yahoo, Mozilla FireFox, Bing and other search-engine providers."

WP Managed Secure servers are specifically designed to protect WordPress websites at all times.

"We are an American-based company that uses real technicians to identify, remove and repair malware and contaminated code that bogs down infected WordPress websites," Voorheis said. "My promise to you is that we will do the finest job possible to keep your website up and running perfectly," he said. "If your site ever goes down for any reason, a skilled technician will immediately be alerted real-time day or night."

Voorheis is an accomplished entrepreneur and realizes that the last thing any business owner wants to deal with is a contaminated, crashed or malfunctioning website.
