

EXHIBITORS displaying Vehicles will be responsible for their own floor protection including drop cloths under engines and boards under tires. Vehicle must be 5 gallons or $\frac{1}{4}$ tank, whichever is less of fuel. Vented gas caps need to be taped (sealed). Batteries are to be disconnected with the cable ends taped and wire-tied down to prevent them from contacting the terminal posts. All vehicles, even electric should be diapered as they still have moving parts that are lubricated. 100% electric vehicles would be exempt from fuel controls. Electric/Gas combo models would follow the rules and regulations for internal combustion engine vehicles (gas, diesel).
