

miSecure
Messages

New
Features

miSecureMessages 6.8

- ▶ **Eliminate the need for scheduled downtime for maintenance** with the High Availability configuration for multiple servers. The miSecureMessages service will automatically seek out the active server when one of the servers is offline, providing continuous secure messaging.
- ▶ Administration Web 6.8 **supports password complexity rules** for administrator logins, in addition to the password complexity rules that were available for Groups in previous versions.
- ▶ **Hide staff phone numbers in the Caller ID.** Phone calls placed from the miSecureMessages app are routed through Genesis, enabling the organization's phone number to be displayed instead.
- ▶ **Provide single sign-on authentication** with integration with SAML (Security Assertion Markup Language) or ADFS (Active Directory Federation Services) authentication layers.
- ▶ The miSecureMessages iOS app adds a **dark mode to iOS devices**. Dark mode was previously limited to Android devices.
- ▶ **Allow or disable photo gallery access** for users sending attachments with Group level permission settings.
- ▶ **Shared devices** enables different users to log into a device and retrieve their messages without having to share logins or an inbox.
