LANDSCAPE BUZZ

A BI-MONTHLY UPDATE FROM MYATT LANDSCAPING & CONSTRUCTION

SEPTEMBER/OCTOBER 2026

GOLDENROD (SOLIDAGO)

Goldenrod (Solidago) is a beautiful native perennial that brings a bright burst of golden-yellow color to the landscape in late summer and fall. With many species native to North Carolina, goldenrod is a valuable addition to pollinator gardens, naturalized areas, and native plantings.

Its tall, branching flower clusters are especially attractive to bees, butterflies, and other pollinators when many other plants are beginning to finish blooming. Goldenrod is also tough and adaptable, tolerating a variety of soil conditions once established.

And one quick myth-buster: goldenrod is not the usual cause of fall allergies! Its heavy pollen is primarily moved by insects rather than wind. Ragweed, which blooms around the same time, is the more likely culprit.

Goldenrod is a great example of a native plant that provides color, wildlife value, and late-season interest all in one.

Wendell Falls EDITION

COMPLETED TASKS

- Bermuda turf aeration for parks
- Second round of nitrogen fertilizer for parks and service areas
- Irrigation maintenance
- Spot spray turf weeds
- Walkway tree trimming

UPCOMING TASKS

- Annual flower install
- Winter turf pre emergent for parks and service areas
