

## OVERVIEW OF TRAINING

---

A little bit of dirt never hurt anybody,” but a little bit from a job site multiplied by the hundreds of job sites in a watershed can add up quickly. Soil erosion has the potential to impact water quality of lakes and ponds which can affect drinking water resources and harm fish and wildlife habitat.

Erosion Control has changed dramatically over the years and new technologies are constantly in development. This full day training will help you stay current on useful practices and will incorporate both classroom sessions and outdoor, hands-on demonstrations in small group settings.
