

MULTI-CHANNEL PAYMENTS PLATFORM

ONLINE PAYMENTS

The Online Payments gateway is an efficient method for consumers to self-manage their payments via secure Internet connection. By simply clicking an access link on the business website, payers are transferred to the secure payment site where they can log in and submit their payment information. Additionally, the Online Payments site can receive an uploaded file for consumer payments due, allowing for auto-population of important data and a more user-friendly payment experience. For business clients desiring an even more seamless user-experience, single sign on from other online systems may also be available. Consumers can submit payments from any checking or savings account as an ACH, credit or debit card, and as a one-time transaction.

PRE-AUTHORIZED RECURRING

Simplify payments by setting them up to automatically recur. MPX offers recurring payments for fixed dollar amounts or a convenient auto-pay feature for payment amounts that vary each billing cycle.

From MPX's administrative controls, business managers can originate pre-authorized recurring debits to their consumers accounts; the perfect solution for your business clients to improve payment success rates.

CALL CENTER & PHONE-BASED

For fast payment entry and immediate funds authorization, the MPX platform includes a number of easy-to-use features for accepting payments over the telephone. Your business and other organization clients will love being able to offer their consumers convenient pay-by-phone options.

TOUCH-TONE PHONE IVR

For an alternative to online web-hosted payments, our Touch-Tone Phone IVR system is a perfect fit for payers without regular internet access. The IVR can be directly accessed via a dedicated 800 number, or possibly integrated as a touch-tone menu option within other IVR phone systems.

IN-PERSON & VIRTUAL TERMINAL

For on the spot and in-person payment transactions, MPX offers an easy-to-use Virtual Terminal feature. Set up shop for over-the-counter payments, self-help kiosks, special events, fundraising, and other similar one-time payment environments. Cards can be authorized for a sale transaction by physical swipe or easily keyed into the web-hosted Virtual Terminal interface.
