Dive Into Data From The Driver's Seat

by Kevin Leiby

This class focuses on diagnosing the vehicle from the driver's seat by taking advantage of a thorough understanding of the system we are faced with and the data PID's available to us today.

Learn to select and group data based on system design and utilize the power of graphing scan data over time to show relational changes over time and responses to inputs. Learn to take full advantage of your scan tool, it is so much more than just a code reader. Drivability concerns can be divided into one of four categories, and we can take advantage of the symptom to help isolate which category our problem falls into to help save valuable diagnostic time. Learn how to use new data PID's that have been added to help increase our abilities and accuracy when it comes to vehicle diagnosis.

Members: \$59
Non-Members: \$79
includes dinner and training

for
shop owners
and
technicians
