

The Durangos have heavy duty suspensions, larger diameter brake discs and shoes, as well as an 8-speed transmission that is specifically tuned for emergency vehicles.

To add realism to our training, the vehicles are equipped with emergency lights and sirens so that students will be put into simulated emergency driving operations while in a controlled environment.

Additionally, the vehicles are equipped with a removable Apex Pro accelerometer. This electronic device provides immediate feedback to students through a series of red or green lights as well as the ability to monitor the device remotely using a mobile device such as an iPad. The Apex Pro will allow instructors to provide timely coaching to student drivers as well as self coaching through the use of its lighted display.
