

The Flashover chamber is a live fire training lab that will teach our students fire behavior and prepare them to understand and recognize two of the most dangerous conditions firefighters may experience in a structural fire environment, **Flashover and Backdraft**.

Additionally, the training prop is mobile. It can be taken anywhere in the United States and train fire fighters from coast to coast.

FLASHOVER = all the contents in a room
reach their ignition temperature and
spontaneously ignite with explosive force

BACKDRAFT = the sudden
reintroduction of oxygen to the
compartment or space will
literally breathe new life into
the fire and cause an explosive
manner that has the power to
blow out windows and doors
