

MONTHLY
CRYPTO REPORT

June 3, 2026

VOL. 1, NO. 3

Written by Gianni Di Poce and Pouyan Zolfagharnia ©

Review

May was another quiet month for cryptocurrency markets. A few of the cryptos covered in this report formed lower-highs with respect to their trends in early-to-mid May, save for Ethereum, which failed to even exceed its high from April 17. The general downward drift continued, and time is starting to run out in terms of saving the potential bullish case near-term.

The alternate, bullish cycle scenarios for the cryptocurrencies covered in this report haven't been abandoned completely, although it is preferred to see strong upside price action in the early phases of new cycles. The fact that there hasn't been an explosive follow-through to the upside since the February lows warns that longer-term cyclical forces are still weighing on this market.

Still, the favorable fundamental backdrop lingers in the background. President Trump continues to position the government as supposedly being "pro-crypto," although in reality, we know that the cycles have to align with the fundamentals in order for such bullish aspirations to play out. From a geocosmic standpoint, it's been rather muted for crypto since Uranus ingressed into Gemini. The greater concern persists with the historical Uranus studies done by Ray Merriman, and how they could tie into cryptocurrencies this time around. Sectors ruled by the sign that Uranus is transiting tend to experience incredible "boom-bust" cycles, whereby prices can appreciate 4-8x (in the crypto case, it was more), but they're then followed by 70-90% declines. But perhaps the worst part is how the previous all-time highs are not exceeded for years, and in some cases, for over a decade.

Look at when Uranus was in Aquarius, for example. The Nasdaq topped out in March 2000 and didn't make a new all-time high until 2015. Then there was Uranus in Pisces for Crude Oil. We still haven't taken out Crude Oil's high from 2008, and it's been 18 years. This type of information isn't meant to instill fear, but rather to raise awareness. The "buy and hold" strategy so fitting to Taurus just isn't going to cut it this time. Gemini, through its mercurial nature, is much more dynamic. Cryptos could very well be entering a new trading era, whereby powerful, volatile price swings in both directions unfold, but in order for that to begin, there needs to be clarity on the state of the 4-year cycle.

Speaking of clarity, last month's report shared, *"The biggest news for crypto over the past month has to do with the Digital Asset Market Clarity Act, otherwise known as the CLARITY Act, which has made significant advancements in Congress. This act grants jurisdiction to the CFTC (Commodities Futures Trading Commission) over transactions in digital assets, including spot or cash markets, and requires digital commodity exchanges to register with the regulatory body. It also serves to distinguish a digital asset as something that relies on blockchains*

for its value, distinguishing it from securities, derivatives, and stablecoins. The bill also allows banks to register as digital commodity brokers and adds additional regulatory safeguards by enhancing tools to combat money laundering and other financial crimes. Furthermore, it prohibits Digital Commodity Exchanges (DCEs) from commingling client funds and prohibits exchanges from trading for their own accounts. These are all very positive developments for crypto as an asset class." One thing is for certain – Wall Street is eager to deploy blockchain technology at scale. JP Morgan is building out a huge crypto division, and many exchanges are looking to move towards 24-hour trade with instantaneous trade settlements made possible via blockchain technology. Plus, we're just several weeks away from the start of the central time band of the trine between Uranus and Pluto that lasts from July 18, 2026, to May 9, 2028. It's as if there's an acceleration towards the future playing out right now, and crypto remains a critical piece of the puzzle.

This month, we're back to looking at the ratio between Ethereum and Bitcoin. Historically, crypto markets have been more rewarding for bulls when Ethereum outperforms Bitcoin than the other way around. As you can see in the ratio below, it peaked back in August 2025 and has been dropping ever since. It's no coincidence that crypto has struggled since then, although from a longer-term trend standpoint, an argument could be made that a correction within a falling wedge pattern is playing out. If the ratio were to break above the upper trendline of the pattern, it would be a positive "risk-on" signal and would imply good times ahead for the crypto space. Moreover, a higher-low would likely occur at the same time, too, which could give the ratio a foundation to reestablish a new uptrend.

In terms of the broader macroeconomic environment, Kevin Warsh became Fed Chair on May 22. This individual seems to have a date with destiny in the next few years, and it was a major topic of discussion at the recent MMA Trading Retreat in Lake Bled, Slovenia. Markets have responded well to his nomination so far, although new Fed Chairs typically experience some volatility in the form of a "test" from the market in the early months of their tenure. If this plays out as history suggests, it's unlikely crypto would be spared from it. The good news is that the overall market's liquidity conditions remain very strong, and it's even been improving due to the recent drop in Crude Oil, which has helped bond prices rally (interest rates come down). It would appear the final

catalyst holding crypto back at this point is a long-term cyclical reset. More on this below.

June 26-29*

July 6**

July 17-20***

Quick Look Report Summary

Bitcoin

Cycle Analysis Overview

- **Longer-term cycles (4-year and 15-month):** Bitcoin is on its way to a 4-year cycle low as June starts the 43rd month of the cycle. Prior 4-year cycles saw 78-84% drawdowns. More downside looks to be on the table. The 15-month cycle (now in the 14th month) also signals a low. The chances of February 6 being a 4-year low are dwindling.
- **Primary cycle outlook:** Unless a long-term cycle low occurred on February 6, the primary cycle remains bearish. It's in the time band for a low, but it needs to drop below 60,000 first. It's setting up to bottom with the greater 4-year cycle.
- **Near-term phase:** Only a potential half-primary cycle low could spare Bitcoin from further bearish woes here. Otherwise, the major cycle points to at least another 5 weeks of falling prices.

Technicals

- **Trend and pattern outlook:** Bitcoin's Basic Trend Indicator flipped back bearish – mixed at best – after

the lower-high on May 6. Prices then took out the April 29 low to the downside.

- **Price targets and downside risks:** A final drop to 52,650 +/- 2,800 looks to be on its way. But a drop to 40,000-45,000 cannot be ruled out either. It's bearish below 74,000-76,000.
- **Momentum:** RSI hit oversold again after failing to hit overbought (above 70) during the multi-month rally.

Geocosmics

- **Major 2026 aspects:** The Saturn-Neptune conjunction on Bitcoin's natal Moon (Feb–May) is the heaviest bearish influence, collapsing illusions about the 4-year crest, confirming the final down-phase, and driving prices lower through fear and hysteria. Jupiter on the Ascendant (triggered July 31) historically marks 4-year troughs and is expected to do so between Aug 2026 and July 2027.
- Jupiter will make the ingress into Leo on June 30. It is worth noting that the 4-year troughs have historically only occurred as Jupiter transits fire signs.

[Bitcoin Trading Strategy](#)

Ethereum

Cycle Analysis Overview

- **Longer-term cycles:** Due to its history, Ethereum has a stronger case that a 4-year cycle may have bottomed on February 6 as well. But if not, then June starts the 48th month. Previous 4-year cycles saw drops of 81-94%, and so far, the drop from the all-time high was ~64%. June starts the 14th month from the April 2025 14-month cycle low, too.
- **Primary cycle outlook:** Under an older and bearish primary cycle scenario, Ethereum is in the time band for a primary cycle low, but it needs to drop below 1751, as we look for the lowest price to be at the end of the cycle when it's bearish.
- **Near-term phase:** Like Bitcoin, only a half-primary cycle low scenario would spare it from more downside. The major cycle scenario points to at least another 4 or 5 weeks of more downside.

Technicals

- **Trend and pattern outlook:** Ethereum's Basic Trend Indicator remains bearish as it keeps making lower-lows and lower-highs. Note how it didn't make a new high in May, while Bitcoin did.
- **Price targets and downside risks:** Ethereum lost key support in the 2000-2100 range. Below there, it's bearish. It looks destined for 1300-1400.
- **Momentum:** The RSI just hit oversold, confirming bears control momentum still. It never hit overbought (above 70) during the multi-month rally into the April high, supporting the idea that it was a corrective rally within a greater downtrend.

Geocosmics

- **Major 2026 aspects:** Transiting Saturn will be crossing over the Ethereum IC this summer (June 30). I would anticipate this event to mark the 4-year trough, before a 15-year period of growth as Saturn moves towards the Midheaven (MC) on the chart.

- Ethereum tends to form its 4-year trough with Jupiter transiting a fire sign. Jupiter will enter Leo on June 30.

[Ethereum Trading Strategy](#)

Solana

Cycle Analysis Overview

- **Primary cycle outlook:** Solana is still 6 weeks away from its historical range for a primary cycle low. The alternate bullish scenario looks less likely this month.
- **Phase breakdown:** It's in the time band for a major cycle trough at any time, as this starts the 9th week of the major cycle phase.

Technicals

- **Trend and pattern outlook:** Solana's Basic Trend Indicator is bearish and keeps making lower-lows and lower-highs.
- **Price targets and downside risks:** The channel projects a potential washout low of 45–50. It would need to get back above 100-105 to look better.
- **Momentum signals:** RSI is hitting oversold again here (below 30), which confirms bears are in control of momentum.

[Solana Trading Strategy](#)

XRP

Cycle Analysis Overview

- **Primary cycle outlook:** XRP's primary cycle is in the 34th week from the October 11 low at 1.75, unless it was a contracted primary cycle low on February 6. Under the older scenario, XRP is already inside the time band for a primary cycle low. New lows, which appear imminent, are each a candidate for a low. The crest formed early on Oct 27 at 2.6942 (week 2), consistent with bearish primary cycles.
- **Phase breakdown:** Three-phase pattern is underway with the final major cycle phase being due at any time under the older primary cycle scenario, but that would require a drop beneath the February 6 low at 1.1273. The final phase is expanding, which isn't unusual when the bigger cycle comes due.

Technicals

- **Bearish trend remains intact:** XRP keeps printing lower-highs and lower-lows overall, which is bearish.
- **Triangle pattern suggests further downside:** A symmetrical triangle on the daily chart still signals downside risks and warns of a trend continuation. The target is 0.75-0.85 for a low.
- **Key levels to watch:** Resistance remains at 1.70–1.80 (former support). If XRP stays below it, bears remain in control. A break below the 1.25–1.30 support level could trigger a move towards the target at 0.75-0.85.

[XRP Trading Strategy](#)

Cardano

Cycle Analysis Overview

- It's in the late stages of the primary cycle from October 17. It's resolving downward after consolidating the losses, and has already taken out the February 6 low.
- If we were in a newer primary cycle, we could be in the 9th week of the second major cycle phase already. Otherwise, we have cyclical overlap for a greater primary cycle low at any time.

Technicals

- **Bearish trend is still in effect:** Cardano keeps printing lower-highs and lower-lows, keeping the technical trend bearish.
- **Rectangle pattern warns of continuation:** The rectangle pointed out last month remains and was validated. A continuation of the bear trend is underway.
- **Key levels and downside risk:** Resistance still sits at 0.33–0.35, while support is breaking at 0.23–0.25. This creates a target of 0.15–0.16. There's some bullish divergence now, so prices could bounce hard from 0.15-0.16.

Bitcoin

Cycle Review

Cycle	Progress
4-year	4 th year
15-month	14 th or 4 th month
Primary (33 weeks)	17 th or 28 th week

The long-term cyclical situation is the most important consideration, not just for Bitcoin, but for the entire crypto sector. This is especially true this month because of the declining prices experienced throughout the month of May. This means Bitcoin could still be in an older 4-year cycle that hasn't bottomed yet. It would also mean lower prices are ahead beneath the February 6 low at 60,008.

Previous 4-year cycle lows unfolded in January 2015, December 2018, and November 2022. 2026 is the 4th year since 2022, and June either begins the 43rd month from the November 2022 low, or the 4th month in a newer and presumably bullish 4-year cycle from February 6. If February 6 was the 4-year cycle trough, then it would have unfolded 39 months from November 2022. Not only would this have been the shortest 4-year cycle both in terms of length, but also in magnitude, because the drop into the February 6 low was just over 50%. Compared to previous declines into 4-year cycle lows, the declines have been around 78-84%.

It could still go either way, but it's imperative to stay nimble and be prepared for either scenario. It's also key to understand that there haven't been many 4-year cycles that have unfolded in Bitcoin, so it may just be that the latest decline was the least severe in history. Since Bitcoin is much more mainstream than before, and institutions are completely immersed, declines may not be as dramatic anymore. For those bigger drops, it may take cycles

greater than 4 years to unfold.

The 4-year cycle in Bitcoin is made up of three 15-month cycle phases. The historical range for the 15-month cycle has been 10-20 months. Most cases have fallen between 15 and 20 months. This is another consideration why the February 6 low wasn't a 4-year low, because it only would have been 10 months from the last 15-month low of April 2025. However, a shorter 15-month cycle wouldn't be completely out of the ordinary, since the greater 4-year cycle was in play. It's not uncommon for shorter cycles to distort when longer ones come due.

If that wasn't the low, then June begins the 14th month, and we would only be one month away from the regular range for a low. Either way, a long-term low is expected by the end of this year. If February 6 was the low, then June starts the 4th month of a new and bullish 4-year cycle, and the expectation here would be for more upside over the next 8 months at least, because the first phase of a new cycle is bullish. This would give Bitcoin a strong bullish bias into year-end and even early 2027.

The primary cycle in Bitcoin comes next. They have a range of 25-41 weeks, and typically, there are 2-3 primary cycles that unfold within a greater 15-month cycle. In the event this is still an older 4-year and 15-month cycle, this week would start the 28th week as measured from the November 21 low at 80,553, but it would also mean we're in the time band for a primary cycle low to unfold at any time. It's just the 15-month cycle that isn't in its regular time band yet.

Under the older cycle scenario from November 21, 2025, Bitcoin is bearish because it dropped below the low that started it. This means new lows beneath February 6 are on the table. This primary cycle completed its crest on January 14 at 98,200, which could lead to another 13 weeks of decline. In this situation, the next primary cycle low would be set to occur simultaneously with the greater 4-year cycle low as well. But in the event Bitcoin

completed its primary cycle low on February 6 at 60,006, which would have been an expanded 43-week cycle from the previous April 2025 low, this week would start the 17th week in this new and potentially bullish primary cycle scenario. However, this bullishness is yet to transpire, which warns of a potential bearish breakdown.

Primary cycles in Bitcoin are comprised of phases that include major cycles lasting 9-13 weeks and half-primary cycles lasting 13-21 weeks. Assuming the correct starting point for the current primary cycle is November 21, 2025, it looks like the first major cycle low formed in the 11th week on February 6, at 60,005, in the February 5-6 CRD. Bitcoin then completed a major or half-primary cycle crest on May 6. However, a half-primary cycle low could still form anytime in the next 5 weeks if we are indeed in a newer primary cycle measured from February 6. If not, this would start the 5th week in the third and final major cycle phase from April 28 at 75,130. Another 4 weeks of falling prices could be in play in this scenario based on the major cycle. Currently, it's looking more like a three-phase pattern is playing out here in the older primary cycle labeling. It should be noted that if Bitcoin is in a newer primary cycle from February 6, and falling into a half-primary cycle low now, the next rally will be important. If the 4-year cycle low is still ahead, then it will be corrective, remaining below the May 6 high, before ultimately falling below whatever low is forming over the next 5 weeks. However, if it takes out the May 6 high, then the more bullish scenario will still be in effect.

Technicals

The selloff over the past month also inflicted damage on Bitcoin's Basic Trend Indicator status. At best now, it's mixed, although the bias is starting to lean a little more bearish. Prices took out the April 29 low to the downside and created a lower-low, and the May 6 high was still below previous important crests. The best hope now for a remedy to this situation is if a half-primary cycle low was completed on June 1. This would give the bulls an opportunity to stay in the game.

Another issue from a technical standpoint rests with the price pattern. It looks like a false breakout from a rectangle pattern played out in early May, which is ominous. But prices would still need to drop beneath the lower trendline of the pattern around 60,000-62,000 to signal a full breakdown. If prices can get back above 80,000-82,000, it would be a bullish catalyst, but the issue is that rectangles are typically considered to be continuation patterns, and the trend in Bitcoin still favors the bearish side of the market. If a breakdown from a rectangle is playing out here, then a final decline to 40,000-45,000 could be in play. Note how this overlaps with another downside target at 37,900 +/- 4500. Additional support in the 52,650 +/- 2800 zone should be noted as well.

Near-term, the most important thing for Bitcoin bulls is to see prices get back and stay above 74,000-76,000. Below there, it's much more vulnerable for a drop down to the lower trendline of the rectangle pattern. It's also ominous how prices rallied for nearly three months, and the RSI indicator never hit overbought (above 70). This implies the rally was corrective in nature instead of being the start of a new bull trend, because there was never a true bullish momentum thrust. The RSI indicator just dropped below 30 (oversold) during this decline, which sends a strong message that another leg lower in prices is around the corner.

Geocosmics

The chart below is sourced from Timing Solution. The black bars represent the daily price of Bitcoin, while the blue curve illustrates the longer-term geocosmic projection derived from historical price action. This projection serves as a timing tool, helping to identify when major market crests and troughs are likely to occur within an orb of 1 month.

Based on the chart, the 4-year crest was expected to form in October 2025, followed by a move down to February 2026, which is precisely what happened. This chart allows us to gauge the timing of the 4-year crest and trough, as well as the cycle phases. Prices continue to consolidate into May, when the second major cycle (or half-primary cycle) crest is expected to form. As noted last month, *"Based on this metric, the crest is due April +/- 1 month, and since we are continuing to rally, the crest is likely to form this month, before the next leg down into the summer."* The crest formed on May 6, and we have now closed out of the bullish price channel. My expectation is for the bearish trend to persist into July to early August.

The next chart is also from Timing Solution. The black bars represent the daily price of Bitcoin, while the pink curve illustrates the medium-term geocosmic projection derived from historical price action. The amber curve is the seasonal projection derived from historical price action regarding the transit of the Sun. The light blue curve represents the short-term price projection, which correlates with the Lunar cycle. This chart is a more precise timing tool used to identify medium and shorter-term market reversal dates within an orb of 3 days:

The two Timing Solution charts should be interpreted by layering them on top of one another. A major or half-primary cycle crest is due April 2026 +/- 1 month. We can refine the timing of this crest by looking at the chart above. As noted last month, *"The next important dates for the formation of a crest are May 12 +/- 3 days, May 27 +/- 3 days, and June 8-9 +/- 3 days at the latest. I would expect Bitcoin to find resistance at the 200-day moving average (MA), which is around the 61.8% corrective rally zone of 83,420 +/- 100 on one of these three dates. Looking back at the final bearish phase of the prior two 4-year cycles, we can see that the 200-day MA acts as resistance, last seen during 2018 and 2022."* We got a double top to the May 6 crest on May 11, and we finally touched the 200-day MA on May 14. As expected, prices were rejected and have turned bearish.

Also noted last month, *"We can also see that the prior 4-year troughs penetrated the 200-week MA, which hasn't occurred yet."* I am now looking to the 200-week MA as the first point of support. The 200-week MA is currently at 61,845 and rising. Since this is above the February low, I am expecting Bitcoin to penetrate the MA.

Transit chart, June 3, 2026 (outer wheel)

The transit charts for the month ahead are shown in relation to the Bitcoin founding chart. The transit path of the Sun (amber), Venus (green), and Mars (red) through the month is shown using arrows.

The most important outer planetary aspects during 2026, in relation to the founding chart, are:

- Transiting Saturn-Neptune conjunction on the Bitcoin Moon (February – May 2026): The natal Moon reflects public sentiment and mass psychology regarding Bitcoin. With the Saturn-Neptune conjunction, we are likely to see the collapse of illusions as market participants accept the notion that the 4-year crest has formed, and we are in the final bearish phase of the cycle. With the 39% drop in the value of Bitcoin from the middle of January to early February, the market perception that the 4-year crest may still be ahead burst, as the primary cycle confirmed the bearish outlook by taking out the low that commenced the cycle on January 31. In general, this is a heavy and negative aspect, which should drive down prices through fear (Saturn) and hysteria (Neptune). Whilst Saturn is now parting from the conjunction with the natal Moon, it is applying to a square aspect with the natal Sun. This aspect is equally challenging and restrictive in nature and should be applying bearish pressure to this asset.
- Transiting Jupiter on the Ascendant of the Bitcoin chart (August 9, 2026): The transiting Sun will be translating this aspect on July 31, which will most likely trigger it on this date. Jupiter will remain in the first house until July 2027. The last time Jupiter made this transit, the 4-year trough formed in January 2015, having dropped 87% from the 4-year crest. I am expecting the current 4-year trough to form between August 2026 and July 2027.
- Transiting Venus on the Ascendant of the Bitcoin chart (June 21, 2026): This event takes place on the Summer Solstice, and whilst I have not observed any major reversals on prior transits, it's worth noting this passage since it corresponds to the June 20 +/- 3 days trough shown by the Venus and lunar cycles in the Timing Solution chart.

Short-Term Solar-Lunar Reversal Dates in Bitcoin (cash market): Look for isolated highs or lows within one trading day of these solar-lunar periods, from which prices reverse at least 12%. These values pertain to the Moon's position at noon GMT instead of noon NYC, since GMT is the change of date associated with Bitcoin.

June 9-11*

June 17-19*

June 24-26*

July 6-8*

Trade Strategies

Position Traders: were stopped out of longs on the close below 70,522. Look to buy back on a drop to 53,000 +/- 1000 with a stop loss on a close below 45,000.

Aggressive Traders: Were flat and advised, *"To go short on a rally to 83,400 +/- 100 with a stop-loss on a weekly close above 85,000 for now. Cover 1/3 at 70,000 +/- 1,000, and another 1/3 at 60,000 +/- 1,000 if offered."* We missed the entry as the crest formed at 82,793, and we tested the 200-day MA below the 61.8% correction zone. Let's go short at current prices with a stop-loss above 71,300 for now. Look to cover 1/3 at 62,500 +/- 1,000,

another 1/3 at 55,500 +/- 1,000, and the remainder at 46,000 +/- 1,000.

Very Aggressive Traders: Are flat. Let's go short at current prices with a stop-loss above 70,000 for now. Look to cover 1/3 at 62,500 +/- 1,000, another 1/3 at 60,000 +/- 1,000, and the remainder at 56,000 +/- 1,000.

Ethereum

Cycle Review

Cycle	Progress
4-year	4 th year
14-month	4 th or 17 th month
Primary (33 weeks)	17 th or 28 th week

Similar to Bitcoin, Ethereum is in a precarious long-term cycle situation. Ethereum is or was much further along in its 4-year cycle versus Bitcoin, as it previously bottomed in June 2022. This was 5 months before Bitcoin's bottom in November 2022. Previous 4-year cycle lows unfolded in October 2015 and December 2018.

In theory, Ethereum may have formed its 4-year cycle low on February 6 at 1,751. If that was the low, it would've been 44 months from the June 2022 low, and it actually would have been one of the longer 4-year cycles in Ethereum from a historical standpoint, but in terms of decline steepness, it was just over 64%. This is significantly less compared to previous declines of 81-94%. If a new 4-year cycle is underway, then Ethereum would be bullish. Otherwise, June begins the 48th month from the June 2022 low. It must also be considered that, like last time, Ethereum already completed its 4-year low, and Bitcoin did not. This may explain some of the emerging strength in the Ethereum/Bitcoin ratio shared above.

The 4-year cycle in Ethereum is made up of three 14-month cycle phases with a range of 9-16 months. Most instances occur between 12 and 16 months. If this is an older 4-year cycle and an older 14-month cycle, June would be the 14th month measured from the previous 14-month low that occurred in April 2025. It would be in

the time band for a low at any time now. But the February low would have been 10 months from the previous 14-month low of April 2025, and in the historical window for a bottom. In the event Ethereum is in a new 4-year cycle, June would start the 4th month, and it would be bullish.

Ethereum's primary cycle is next to consider. It typically occurs two or three times within the greater 14-month cycle. Primary cycles in Ethereum can last 25-41 weeks. In the older and bearish primary cycle scenario, Ethereum begins the 28th week, measured from the November 21 low at 2627. However, the alternate, and more bullish scenario is centered around an expanded primary cycle bottom on February 6 at 1,751. This would have been 43 weeks from the April 9, 2025, low (which was also a 14-month low).

If still in an older cycle, Ethereum is in the late stages of the third and final primary cycle phase within the greater 14-month cycle, as well as being in the third and final 14-month phase within the greater 4-year cycle. It's in the time band of the regular orb for a bottom, but a selloff below the February 6 low at 1,751 may still happen. If it's a newer primary cycle, Ethereum would have 4-year, 14-month, and primary cycle tailwinds behind it, and would prevent a further breakdown. Last month's report explained, *"It also helps that Ethereum rallied to its cycle high at 2,464 on April 17, because typically bearish primary cycles see their crests between weeks 2-8, whereas this April 17 high occurred in the 10th week. This also supports the bullish narrative."* However, the issue that developed over the past month is that Ethereum didn't make a new cycle high in the month of May, whereas Bitcoin did. This set up a case of intermarket bearish divergence, and warned of a reversal back lower, which unfolded accordingly. This is an excellent segue into the technical situation for Ethereum.

Ethereum's primary cycle is made up of phases that feature major cycles lasting 9-14 weeks and half-primary cycles lasting 12-20 weeks. There are still two major cycle scenarios for Ethereum. The first surrounds a major cycle trough on March 30, which occurred one day outside the orb of the April 3-6 CRD. This would therefore begin the 10th week of the third and final major cycle phase. A low would be due within 4 weeks in this case.

However, a potential major cycle trough could have taken place on April 29 at 2220, which would have been 12 weeks from February 6. A major cycle crest would have occurred on May 6 at 2,430, and in this case, Ethereum starts the 5th week in the third and final major cycle phase. There's a chance that Ethereum is forming a half-primary cycle low now, although it doesn't seem very likely.

Technicals

Ethereum's technical situation is weaker than Bitcoin's now, especially after the lower-high from May 6, which came in beneath the high from April 17. Prices then took out the April 29 low to the downside, so there's been a series of lower-lows and lower-highs over the past month. This supports the bearish trend outlook for Ethereum. Prices would have to get back above the April 17 high at 2,472 to send a strong signal that the Basic Trend Indicator is turning bullish, and it would also support the newer primary cycle outlook. Otherwise, it's vulnerable from a simple trend standpoint.

From a price pattern standpoint, last month was considered an ascending price channel setup in Ethereum. It stated, "*Channels are continuation patterns and leave the door open for more downside. Ethereum's bullish outlook looks much better when it's above 2,300-2,400, which is where it's holding right now. Below there, it's vulnerable to more downside, and is outright bearish below 2,100-2,200. To confirm a breakdown from the channel, prices would have to close below the lower trendline of the pattern and mean a drop as low as 1,050-1,400 is in the works.*" No change here, although in the bullish scenario, an argument could be made that a rounding bottom pattern is forming. Prices would have to close above 2427 in order to signal a breakout from this pattern, and it could open the door for a rally to 3300-3400. But the fact that the RSI indicator never hit overbought during the rally from the February 6 low is a concern. It implies a corrective rally within a broader bear trend is all that played out. Now, the RSI indicator just dropped below 30 on this decline, confirming bear control momentum. This is setting up for a washout to 1300-1400.

Geocosmics

Ethereum genesis block (Block 0), July 30, 2015, 15:26:13 UTC (inner wheel)
Transit chart, June 3, 2026 (outer wheel)

The chart is sourced from Timing Solution. The black bars represent the daily price of Ethereum, while the amber curve is the inverse of the seasonal projection derived from historical price action regarding the transit of the Sun. At times, we see the inverse pattern performing better, as it has been doing over the past year. The light blue curve represents the short-term price projection, which correlates with the Lunar cycle.

As noted last month, "This chart indicates that the second major cycle crest was due in April 2026 +/- 1 month. We can refine the timing of this crest by applying the Lunar cycle (light blue cycle). If the crest did not form on April 17, it is next due to form on May 11 +/- 3 days or June 7-8 +/- 3 days and will most likely form by re-testing the upper boundary of the price channel or the 200-day MA." The April 17 high held, and the lunar cycle does not currently appear to be active.

The transit charts for the month ahead are shown in relation to the Ethereum founding chart. The transit path of the Sun (amber), Venus (green), and Mars (red) through the month is shown using arrows.

The most important outer planetary aspects during 2026, in relation to the founding chart, are:

- Transiting Saturn entering Ethereum's 4th house and IC (June 30): Whilst we don't have any prior occurrences, I would expect this event to coincide with a significant trough for Ethereum. Since this aspect is still forming, my bias is that we are likely to see another move down before the 4-year trough forms.
- Transiting Jupiter is entering Leo. Ethereum tends to form its 4-year trough with Jupiter transiting a fire sign. The prior 4-year trough formed on June 18, 2022, with Jupiter at 6° Aries. The 4-year cycle before that formed on December 14, 2018, with Jupiter at 7° Sagittarius. Unfortunately, we don't have any data before that, but 7° fire signs appear to be active since the natal Sun is at 7° Leo. Jupiter will be transiting this point on August 1. If this correlation is to hold, we should not see a trough form before Jupiter enters Leo on June 30.

During the month of June, the following important transits will take place:

- Transiting Sun will be translating Jupiter transit described above, with a conjunction to transiting Jupiter on July 29 +/- 3 days. From a geocosmic perspective, this is an ideal date for the 4-year trough to form. In the two prior cases of the 4-year trough forming, the Sun was either transiting the 1st or 7th house. The Sun has entered the 7th house today and will be there until July 12. Therefore, we cannot rule out the possibility that the 4-year trough may form after Jupiter enters Leo (June 30) and before the transiting Sun leaves the 7th house (July 12).

Trade Strategies

Position Traders: were stopped out of longs on the close below 1,941. Look to buy back on a drop to 1350 +/- 50 with a stop loss on a close below 1100.

Aggressive Traders: Were flat and advised to "Go short at 2,465 +/- 25 with a stop-loss on a weekly close above 2,475." We missed the entry as the crest formed at 2,424. Let's go short at current prices with a stop-loss above 1,950. Cover 1/3 at 1,700 +/- 50, another 1/3 at 1,500 +/- 50, and the remainder at 1,400.

Solana

Cycle Review

The focus for the other Altcoins, like Solana, in the MMA crypto report is on the primary cycle and its phases, since the longer-term cycles follow Bitcoin and Ethereum's long-term cycles very closely. Solana has a primary cycle that lasts 37 weeks with a range of 30-44 weeks.

The favored primary cycle scenario for Solana begins at the December 18 low of 117.16, which would mean that this week starts the 24th week. Solana would still be undergoing a bearish primary cycle because prices dropped below the December 18 trough to the downside. This would signal at least another 6 weeks of falling prices before it reaches the time band for a primary cycle low. The cycle high and primary cycle crest that occurred in the 4th week on January 14 at 143.37 was a bearish signal. It unfolded in the 2–8-week window for a bearish primary cycle.

Similar to Bitcoin and Ethereum, there's an alternate label that needs to be considered, too. There's a chance that Solana formed a primary cycle low on February 6 at 68.45, and if so, it would have been 43 weeks from the April 7, 2025, trough. It's noteworthy how this low would have been in the regular 30–44-week range for a primary cycle trough, and so at the least, it needs to be considered as a candidate trough. This would make the week of June 1 the 17th week in a newer and potentially bullish primary cycle in Solana.

Solana's primary cycle breaks down into phases, including half-primary cycles that last 15-22 weeks and major cycles that last 7-14 weeks. In an older primary cycle scenario from December 18, the first phase low bottomed on February 6 at 68.45, in what was the 7th week of the cycle. Another major cycle trough could have formed on April 2 at 76.73, which was right in the April 3-6 CRD, and 8 weeks later. A major cycle trough here is due, as we're

9 weeks from the April 2 low. But it may take as long as 5 weeks for that low to form.

Technicals

Unlike Bitcoin and Ethereum, Solana made some progress regarding its Basic Trend Indicator over the past month. The May 11 high at 98.35 was higher than the March 17 high at 97.64. This created another higher-high. But prices just took out the April 2 low at 76.73. The trend remains bearish.

Prices also just broke below the lower trending line of the ascending price channel. These are continuation patterns, and the trend is still bearish. This warns of another leg lower in Solana. Prices have spent the last several weeks correcting into an ascending price channel, and have built up the energy for the next leg lower.

As a result, we can turn to support and resistance levels for more guidance. Solana remains vulnerable to more downside as long as it's below resistance at 100.00-105.00. Beneath this level, bears have an edge. Only a close back above 120.00-125.00 would confirm that a real low is complete. Until then, preparations must be considered for additional downside. Last month stated, *"The ascending channel warns of a washout as low as 45.00-50.00 in Solana, but if prices drop into that zone, a tremendous buying opportunity may be presented. There are still problems when it comes to momentum, as the RSI indicator remains tilted towards the bears. It remains in the corrective 40-60 zone, and only an overbought reading above 70 during a rally would erase momentum concerns."* No change here, and now it's hitting oversold (below 30). We could see a bounce, but the bigger signal is if prices take out the February 6 low at 68.45 to the downside, and the RSI doesn't make a new low.

Trade Strategies

Position Traders: Are flat and may go long on a close above 95.80 with a stop-loss on a close below 79.15 or go long on a drop to 50.00 +/- 2.00 with a stop-loss on a close below 52.50 – whichever happens first.

Aggressive Traders: Were stopped out of the short trade. Let's go short again at current prices with a stop-loss above 87.91. Cover 1/3 at 65.00 +/- 2.00, another 1/3 at 54.00 +/- 2.00, and the remainder at 40.00 +/- 2.00 if offered.

XRP

Cycle Review

XRP also continues to dance between two potential primary cycle scenarios. The range for the primary cycle in XRP is 22-41 weeks, with a mean periodicity of 31 weeks. The alternate primary cycle scenario here has to do with a case of cyclical contraction, however.

Unlike the other altcoins covered in this report, XRP has much more price history, with data going back to mid-2020. This provides higher confidence levels with respect to the primary cycle studies, especially. However, its behavior is a bit more volatile compared to the other ones, and its primary cycle has a wider range compared to other cryptocurrencies.

Independent of whether XRP is in a newer or older primary cycle, the October 11 low at 1.75 is a good starting point of reference. If this is an older and bearish primary cycle, this week begins the 34th week measured from that low. XRP would therefore be in the time band for a primary cycle trough, and it would be due within the next 7 weeks. However, a new cycle low would be expected since this cycle is bearish, and the lowest price in bearish cycles occurs at the end. In this scenario, the primary cycle crest was on October 27 at 2.6942, in the 2nd week of the primary cycle.

This is a typical pattern in bearish primary cycles, whereby crests occur between weeks 2-8. Even so, there is a chance that a contracted primary cycle low occurred on February 6 at 1.1273. This low would have unfolded in the 17th week, so it was outside of the regular 22–41-week range, and experienced contraction. However, if the greater cryptocurrency sector completed a long-term low on that day, this possibility cannot be discounted. This week would start the 17th week under that scenario.

Then come the phases of XRP's primary cycle. There are half-primary cycles that last 11-20 weeks and major cycles that last 7-10 weeks. The preferred cyclical breakdown depends on whether a newer or older primary cycle is in effect. Previously, it was for a three-phase pattern, with major cycle lows occurring on December 19 in the 10th week and February 6 in the 17th week. February 6 was 7 weeks from December 19. This would mean the third and final major cycle phase from February 6 has begun to expand, as this would start the 17th week. This doesn't seem very likely, as this would be in half-primary cycle length land. This actually supports the newer primary cycle labeling, although if a longer-term cycle is playing out here, things could get erratic with the trading cycles. Regardless, cyclical overlap is present for a primary cycle low at any time.

In the event this is a newer primary cycle from February 6, a major cycle trough was completed on April 2 at 1.2803. It would be due for a major cycle low at any time now, as it's in the 9th week from April 2.

Technicals

There's been no improvement on the trend front over the past month in XRP. It made another series of lower-lows and lower-highs, with the May 28 low at 1.2670 taking out the April 2 low at 1.2803 to the downside. It would have to rally above the recent major cycle crest at 1.5494 on May 14 to start turning the tide against the bears.

Last month's report also stated, "*... the price action since February 6 could be construed as a consolidation of the losses, which is often bearish price action...there is still the symmetrical triangle on XRP's daily chart, and these patterns typically lead to a continuation of the underlying trend. As mentioned above, the trend is bearish, and at best, mixed. If prices drop below the lower trendline of the triangle, another decline to new lows could easily follow.*" It started breaking below the lower trendline of the pattern and looks to be setting up for a flush lower now.

To actually turn bullish again, XRP would have to overcome former support-turned-resistance in the 1.7000-1.8000 zone. Until prices rally back above there, bears will continue to have the edge from a technical standpoint. In terms of support, we saw the importance of 1.2500-1.3000 just last week, as that's where the May 28 low formed. If level breaks, it opens the door for a washout below the triangle formation. The downside objective from this pattern could be as low as 0.7500-0.8500 and would present an excellent long-term entry opportunity.

When it comes to momentum, bears are still in control. Even though XRP rallied for months, the RSI indicator never hit overbought above 70. This suggests it was just a corrective rally within a greater downtrend. If XRP breaks above 1.7000-1.8000 and hits an overbought reading above 70, it will signal that bulls are starting to regain control of the market. However, it's hitting oversold (below 30) again, so it looks like bears still control momentum.

Trade Strategies

Position Traders: Are flat and may go long on a drop to 0.8000 +/- 0.0500 with a stop-loss on a close below 0.6500 or go long on a close above 1.5335 with a stop-loss on a close below 1.3465 - whichever happens first.

Aggressive Traders: Are short as advised, "*Look to go short on a daily close below 1.3450 with a stop-loss on a weekly close above 1.4410.*" The short was triggered on May 22. Cover 1/3 at 1.1800 +/- 0.0500, another 1/3 at 1.0600 +/- 0.0500, and the remainder at 0.9100 +/- 0.0500 if offered.

Cardano

Cycle Review

The multi-month consolidation near the lows in Cardano continued over the past month. The cyclical and technical price action is still bearish, but now, it's in the time band for a primary cycle low, especially under an older primary cycle scenario. Primary cycles in Cardano last 31 weeks and have a range of 24-38 weeks. This week begins the 33rd week measured from the October 17 low at 0.5939. Since prices took out the February 6 low, the alternate labeling is no longer considered.

Since this is an older primary cycle from October 17, a new low beneath 0.2238 was anticipated, and is unfolding now. The lowest price of bearish cycles is at the end. Moreover, the primary cycle crest unfolded in the 2nd week with the October 27 high at 0.6933.

Cardano's primary cycle is made up of phases that include half-primary cycles that last 12-20 weeks, or major cycles that last 7-14 weeks. Combination patterns occur when both play out. A three-phase pattern is playing out in the current primary cycle. Last month's report stated, *"The last major cycle trough would have been on February 6, and this week starts the 13th week from that low. This implies that a primary cycle low could unfold within the next two weeks, but only if it drops below 0.2238. If February 6 was a primary cycle low instead, then there's a candidate for a major cycle low on March 30 at 0.2338, in what would've been the 7th week of the primary cycle. Another major cycle trough would be imminent, as this week would begin the 6th week in the second major cycle phase. It could go either way right now."* This remains pertinent. If March 30 was a low, this would start the 9th week in the newer major cycle. It just took out 0.2338 to the downside, and signals a drop into a primary cycle low is now unfolding. With respect to the major cycle, a low could form within the next 5 weeks, and although there's a slim chance it occurred on May 28 at 0.2279, this is not my bias.

Technicals

Cardano's technical situation remains bearish. It hasn't made any significant higher-highs or higher-lows, and instead, just keeps making lower-lows and lower-highs. This keeps the trend bearish, and prices are starting to break down after consolidating near the lows.

Last month's report also explained, *"The bearish trend in Cardano is compounded by the rectangle pattern presenting itself on the daily chart. These are also continuation patterns, which warn of further downside in Cardano. As a rule, consolidations near the lows of a move are considered to be bearish price action, and that's exactly what's observed in Cardano right now."* No change here – the pattern is still in effect.

The rectangle pattern is still the dominant formation in Cardano's chart. It looks like a resolution is happening now, and it warns of a continuation of the trend to the downside, especially if prices close below the lower trendline of the pattern. To turn bullish, Cardano would need to close above 0.3300-0.3500, which is resistance. Note how it's testing the key support zone at 0.2300-0.2500 now. These levels also represent the upper and lower bounds for the rectangle formation in Cardano. The rectangle pattern projects a drop to the 0.1500-0.1600 zone if prices break below support. If prices were to clear resistance at 0.3300-0.3500, a rally back to 0.4200-0.4300 could ensue.

Note how during the rally into the May 11 high at 0.2836, the RSI indicator could never manage to hit overbought (above 70). It's an ominous sign that Cardano rallied for over 2 months without hitting overbought, and it warns that the rally was just corrective. Be alert for a drop to new price lows, but not in the RSI, as that would create a case of bullish divergence. This signal's downside momentum has waned, and it's something that often presents itself at market bottoms. There's some now, but it's still early in the breakdown to call it a bottom.

Trade Strategies

Position Traders: Are flat and may try the long side on a drop to 0.1700 +/- 0.0100 with a stop-loss on a close below 0.1200. Conversely, go long on a close above 0.3097 with a stop loss on a close below 0.2140 - whichever happens first.

Aggressive Traders: Were stopped out of the short trade. Go short at current prices with a stop-loss above 0.2400. Cover 1/3 at 0.1850 +/- 0.0100, 1/3 0.1000 +/- 0.0100, and the remainder at 0.0500 +/- 0.0100 if offered.

ANNOUNCEMENTS & EVENTS

ANNOUNCEMENTS

NOTE 1: [THE ANNUAL MMA MID-YEAR MARKET WEBINAR](#) WITH MMA MARKET ANALYSTS WILL TAKE PLACE ON SATURDAY, JUNE 20, AT 1:00 PM EDT!!! In the comfort of your own home or office, you can tune in to MMA's annual Mid-Year Financial Markets Update Webinar. This year's webinar will be in a slightly different format than previous years. It will be hosted by Raymond Merriman, who will introduce each market and then conduct an interactive interview with the MMA analyst covering that market, discussing its outlook for the second half of 2026. The analysts and markets to be covered this year will include Bitcoin (Merriman), NASDAQ (Wiebke Held), S&P 500 and T-Notes (Gianni Di Poce), Euro (Ulric Aspegren), Silver and Crude Oil (Pouyan Zolfagharnia), and Gold and Soybeans or Wheat (Wyatt Fellows). This webinar/workshop will last approximately three to four hours, with two five-minute breaks. The cost is \$66 (a super bargain for a workshop covering these markets), which includes access to the live presentation via Zoom, the presentation slides, and the video recording of the live event that will be available within 24 hours after the presentation. This is MMA's annual mid-year financial markets update webinar. If you are unable to attend live, the video recording will be available the following day. To register, [click here](#).

NOTE 2: THE RECORDING OF THE FREE CRYPTO WEBINAR, HELD ON APRIL 8, IS NOW AVAILABLE!!! [Click here](#) to watch it on YouTube. Are you new to the Crypto world? Do you wonder how to trade cryptocurrency via wallets, futures, or ETFs? These and other topics are covered in this special instructional webinar on the new MMA Monthly Crypto Report. This [FREE WEBINAR](#) explains how to use the new monthly Crypto report for maximum value. Ray Merriman hosted this webinar, joined by Gianni Di Poce, Pouyan Zolfagharnia, and MMA President Wyatt Fellows.

NOTE 3: THE [MMA 2026 TRADING AND INVESTMENT RETREAT](#) WAS AMAZING! The best yet! Recordings are now available. Catch the excitement of this amazing event while it's hot!

This special four-day retreat started off with Ray Merriman's introduction to the "Post-Aries Vortex Era" that officially began with the geocosmic setup of February 20, 2026, and the political event of April 7, 2026, that gave peace a chance.

This retreat included special presentations and interactive discussions on current and future world conditions through 2030 that are likely to affect financial markets. These were led by world-class mundane astrologers Claude Weiss (Switzerland), Christeen Skinner (UK), Christof Niederwieser (Germany), Pouyan Zolfagharnia (UK), and Raymond Merriman (USA). Joining them to discuss MMA timing methods and short-term trading strategies were MMTA Director Wiebke Held (Germany) and MMA analysts Wyatt Fellows (USA), Ulric Aspegren (Switzerland), Gianni Di Poce (USA), and MMA Trading Coach Rita Perea (USA).

The retreat covered the unique, research-based MMA methods for identifying primary, half-primary, major, and trading cycles. *It also covered the setup and steps required for applying MMA's solar/lunar reversal dates for very short-term aggressive trades in Bitcoin, stock indices, and precious metals.*

To order the recordings of this special event, please [click here](#).

NOTE 4: A SIX-WEEK SUMMER SCHOOL COURSE ON ESOTERIC ECONOMICS BY GIANNI DI POCE WILL BEGIN ON SUNDAY, JULY 12. Stay tuned for details and registration information. This course will be based on Gianni's new book of the same name, which has just sold out its first printing. A second printing will be ready in time for this course.

NOTE 5: Speaking of new books and printing... Ray Merriman has just completed the writing of *Jupiter and Saturn Transits: Mastering the Cycles of Life*. This 400+ page book covers all the major transits of Jupiter to one's natal planets and angles, including interpretations of the opening and closing sextiles, squares, and trines. The Saturn section also includes the opening and closing semi-square and sesquiquadrate transits to all natal planets and angles, plus the "Business Cycle" of Saturn as it transits up the chart from the IC to the MC, and then back down again from the MC to the IC. It also ranks each transiting aspect between -3 and +3 in terms of trading and investment potential, which alone is worth the price of the book. Transits are the most important forecasting tools in any professional astrologer's skill set, and the book explains the techniques used to apply transits in one's consulting practice. This book shows how transits are used in forecasting events and periods of conflict and opportunity that shape one's destiny and, hence, identity. Stay tuned for a special pre-publication offer for the first edition of this new book by Ray Merriman, due out in August, which promises to become a classic reference source of personal guidance for both professionals and students of astrology for many years to come.

NOTE 6: WE HAVE JUST COMPLETED A NEW UPGRADE FOR THE FAR FOR GALACTIC TRADER SOFTWARE PROGRAM!!! We can now conduct solar/lunar weighted value studies for any market by isolating or omitting any planet that is retrograde! For instance, we can now compare solar/lunar values for any market when Mercury (or Venus, Mars, or any planet) is retrograde or direct, or both. This is important because we have noticed that when Mercury is retrograde, the lunar values for Bitcoin perform differently in many cases than when Mercury is direct. If you don't own the FAR for the Galactic Trader program, which is key to conducting MMA research studies to identify turning points in any financial market, and you wish to know more about it, please [click here](#). The cost is \$1895 (end-of-day version) and includes Jeanne Long's Galactic Trader software, featuring extensive W. D. Gann trading tools that she created.

NOTE 7: RECORDINGS OF MMA'S SPECIAL [SIX-WEEK COURSE ON "THE BASIC PRINCIPLES OF GEOCOSMIC STUDIES FOR FINANCIAL MARKET TIMING"](#) ARE NOW AVAILABLE!!! Led by Gianni Di Poce and supported by Ray Merriman, this course is designed to teach students the basic principles of planets, signs, and aspects (including retrograde and direct stations) as used in MMA's market-timing methodology — one of its most important tools. The course explains which planets and signs rule the various sectors of the economy and financial markets. In addition, it covers how to use an ephemeris and astrological software (Solar Fire) for important routines such as calculating charts, generating transit "hit lists," and identifying signs, ingresses, planetary stations, and aspects — the essential cosmic features necessary for determining market reversal periods.

The course is especially useful for those interested in taking the two-year program offered by the Merriman Market Timing Academy or for anyone wishing to deepen their astrological knowledge. The cost for these six introductory lessons, each lasting about two hours, is \$300. This is a great opportunity to learn basic astrology from an excellent economic astrologer! [Click here to order now!](#)

NOTE 8: THE [JUPITER REPORT: YOUR MOMENTS OF OPPORTUNITY!](#) The *Jupiter Report* is written by Raymond Merriman. It is a 30- to 40-page report that all traders (and even non-traders) will find highly valuable. It identifies the times during the year when Jupiter transits are highlighted in your natal chart and explains the meaning of Jupiter's transits to your natal planets and angles over a 14-month period (including one month before your order date and one month after the year ends). *As an added bonus, each transit is ranked on a scale from -3 to +3 in*

terms of favorability for trading. Traders may find this especially valuable! Would you like to know if you are under a +3 transit and therefore most likely to experience trading success? Or a –3 transit, with a stronger-than-usual potential for misjudgments that can be costly? The price for a personal 14-month *Jupiter Report* based on your birth data is \$69.

Coming soon! *The Saturn Report: Mastering Your Life Cycles*. Due out in late summer.

NOTE 9: THE [MMA SOLAR-LUNAR APP](#) OFFERS REVERSAL SIGNALS FOR THE DJIA, NASDAQ, GOLD, AND SILVER. It is an ideal tool to have in your back pocket if you are a short-term swing trader looking for high-probability dates that identify isolated lows and highs in these markets. Please note that this should not be used as a standalone system. It works best as an adjunct tool when cycle lows or highs are due, when a market is in a technically overbought or oversold condition, or when it is exhibiting intermarket bullish or bearish divergence relative to a related market. The app is currently available only on Apple devices (iPhone and iPad). **To learn more about the MMA app, [click here](#).** To order, go to the Apple App Store and search for *Merriman Solar/Lunar Reversals*.

NOTE 10: THE NEW AUDIOBOOK OF *EVOLUTIONARY ASTROLOGY: THE JOURNEY OF THE SOUL THROUGH STATES OF CONSCIOUSNESS*, by Raymond Merriman, written in 1993, is now available! It is narrated by Thomas Miller, who has a great voice and also broadcasts MMA's free weekly column. The first edition of *Evolutionary Astrology*, originally published in 1977, introduced this remarkable subject to the astrological community, where it has since become one of astrology's major branches of study. Get ready to listen to the original work on Evolutionary Astrology that brought a spiritual perspective to the study of astrology from the late 1970s through today. To order the book (hardcover or eBook) or the audio recording, please [click here](#).

NOTE 11: For a look at MMA's newest advances in AI, [click here](#). New short videos are now available — [click here to watch](#).

EVENTS

JUNE 20, 2026: MMA'S ANNUAL MID-YEAR MARKETS UPDATE WEBINAR. Save the date! Note that the date has been moved up one day to Saturday, June 20, at 1 PM EDT.

JULY 12, 2026: "Esoteric Economics" course begins with Gianni Di Poce. Stay tuned for details.

SEPTEMBER 3, 2026: A UAC PRE-CONFERENCE WORKSHOP ON FINANCIAL ASTROLOGY BY RAYMOND MERRIMAN, 1:00–5:00 PM. This workshop will take place at the United Astrology Congress (UAC), the largest astrological conference in the world, which is held every four to eight years. More than 150 world-class astrologers will be presenting, and over 1500 attendees will be present. The conference will be held at the Marriott Downtown Chicago Magnificent Mile Hotel. In addition to the workshop, Ray will present another lecture during the six-day event on mundane astrology, titled "What Is Happening in the World from an Astrological Viewpoint," on September 5. **For more information, visit www.uacastrology.com.**

PLEASE NOTE: THE INFO IN THIS REPORT IS FOR THE PRIVATE USE ONLY OF MMA CYCLE SUBSCRIBERS. THE TRANSMISSION OF THIS REPORT BY ELECTRONIC MEANS OR OTHERWISE IS ILLEGAL UNLESS PERMISSION IS GRANTED BY MMA, INC.
