

Disinfecting from COVID-19 with a Floor Scrubber

For maximum results when using a Floor Scrubber to sanitize and disinfect floors, follow these instructions:

#1- Clean floor normally using either the disinfectant cleaner or standard floor cleaner/degreaser and pick-up waste water. It is important to remove gross and visible soils before applying disinfectants to any surface. Not cleaning the floors first diminishes anti-microbial activity as the active ingredient in the disinfectant is "overwhelmed" with a bio mass it cannot handle.

#2- Apply [Disinfectant](#) using [Floor Scrubber](#), at heavy application setting, but DO NOT VACUUM-UP!!

#3- Allow disinfectant to dwell on the flooring surface for **10 minutes**. Then squeegee and vacuum floor of all disinfectant cleaner.
