

The Roto Patio Inowa system features an innovative closing movement which provides a superior level of impermeability and lower energy costs for the user. In addition, the Roto Patio Inowa system allows for comfortable operation, with no lifting of the sash, and a clean aesthetically pleasing design with no components protruding into the passage opening.

The Patio Inowa is a hardware solution for sliding patio doors designed to provide high thermal performance levels. The hardware system incorporates a continuous gasket system around the operable sash, along with concealed lock points even in the mullion

area where the sashes come together. The system's rollers will support operable panel up to 5 by 8 feet and 440 lbs.

The Roto Patio Inowa won a 2017 Reader's Choice Award from DWM magazine. The winners are chosen through a survey of the publication's readers who vote for their favorite products in several categories.

"We are pleased and honored to receive this award," said Chris Dimou, President & CEO of Roto North America. "It shows that our efforts to continually enhance the level of our services, and provide superior customer value have been recognized."
