

Stanford Research Study
Rodriguez/Translational Therapeutics Laboratory

Do you worry: About getting sick, hurting someone, thinking bad thoughts, or not doing things right? About your appearance? About your health?

Are you 18-65 years old?

Are you taking fluoxetine, or not taking medications?

We are actively screening individuals with obsessive compulsive disorder (OCD) and the related disorders body dysmorphic disorder (BDD), illness anxiety disorder (IAD) and somatic symptom disorder (SSD) for our **Flex Study** (**F**luoxetine/**D**extromethorphan in Obsessive-Compulsive and Related Disorders: an Open-Label Crossover Pilot Study).

Purpose: To understand whether dextromethorphan, an over-the-counter cough medicine, may bring about improvement in symptoms of OCD and other disorders characterized by recurrent intrusive thoughts when used together with fluoxetine.

To participate in the study:

Contact: 650-723-4095 or ocdresearch@stanford.edu for more information.

Physician Investigator: Peter van Roessel, M.D, Ph.D.,
Stanford University Medical Center
