RadComp Quality of Life Questionnaires FAQs⚓

Read the full blog

An important piece of what we hope to learn from the RadComp Study is about participant's "Quality-of-Life" (QOL). This information is reported by our participants themselves. In designing the study, physicians, breast cancer survivors and advocates told us they wanted to know if and how Quality-of-Life changes as a result of undergoing radiation therapy.

What is a Quality-of-Life (QOL) questionnaire?
These questionnaires ask about physical, emotional, and social well-being before and after cancer treatment. For example, they will ask about such things as energy level, emotional support, and whether treatment met expectations.

Why are these questionnaires important to the study?
Our participants providing this information will help physicians and patient care-givers focus on the specific needs of patients during and after radiation treatments.

When do questionnaires need to be completed?

- When a participant first joins the study
- 1 month after end of radiation
- 6 months after end of radiation
- 12 months after end of radiation
- Once annually for a period of 10 years to helps us track long-term health.

Participants receive email and/or phone reminders when it is time to complete questionnaires.

How long do questionnaires take to complete?
The questionnaires take approximately 30 - 40 minutes to complete. Exact times may vary.

How can I complete the questionnaires?

- Questionnaires can be completed on paper during a regularly scheduled visit with your doctor, by mail, or online through **VisionTree.**
- Participants can **change their preferences** for completing questionnaires online or on paper at any time.
- If you complete questionnaires online and have forgotten your **VisionTree** username or password, please **contact us.**
