

Douglas Plant Health : AgriEnergy Resources of Princeton, IL has a mission of building biologically healthy soil fertility. It's one of the nation's most experienced and respected providers of biologically beneficial fertility — and the educational services to make it effective.

We have found synergistic responses between WakeUP Summer and Accelerator, the foliar fertility product.

The chart at right shows the summary of such a field trial. The field trial shows the averages of three replications each... with a yield increase of 13 b/ac.

WakeUP was also lab-tested to see if it has any impact on the bacterial and mycorrhizal organisms in **Residue**, one of flagship biological products.

Residue is a crop residue digester which speeds conversion of raw cellulose and lignin into active humus and available NPK. The petri dish test showed WakeUP Spring's formulation was benign in the petri dish.

Thus, we're increasingly comfortable with adding WakeUP Spring with nutrients and biological blends in-furrow, near the seed. Farmers tell us that WakeUP Spring applied in-furrow or 2x2 helps mobilize NPK and trace elements into the root.
