

CONVERT INVENTORY INTO CASH WHILE DECREASING SURPLUS.

The Datarithm® Solution optimizes inventory through automated demand forecasting and inventory balancing. Improved fill rates lead to maximized customer service. Cycle counts are configured to your specs to flag diversions and keep precision inventory information.

BALANCING

Our Balancing engine reveals positions of surplus inventory. Daily return to wholesaler lists are generated to act upon. Datarithm® can make automated recommendations for “cold-to-hot” store-to-store transfers, while the system provides return alerts for both in-date and short-dated inventory.

CYCLE COUNTING

Accurate on-hand counts allow The Datarithm® Solution to function with the most accurate data. Reports help make your Cycle Counting inventory efforts even more useful in your overall inventory management program.

FORECASTING

The Datarithm® Solution Forecasting engine performs an in-depth analysis of historical transaction data, selects proper forecasting logic to precisely forecast future demand. Datarithm® then automatically optimizes reorder points and quantities in each location's pharmacy management system.

ADVANCED ANALYTICS

The Datarithm® Solution Analytics Engine allows you to access a wide array of information at any time of the day or night through a cloud-based network. Simply log on to your system, any time, day or night 24X7.
