

## About EarliPoint...

EarliPoint™ is an FDA-authorized evaluation tool designed for children aged 16 to 30 months. Using innovative eye-tracking technology via a tablet-based medical device, this cutting-edge tool assesses social visual engagement to provide object measurements of a child's strengths and vulnerabilities in three key areas: social disability, verbal ability, and non-verbal learning. EarliPoint provides an engaging method to accurately and efficiently assess a child suspected of autism, giving parents and caregivers the answers they're searching for at an age when the most gains can be made.

**Easterseals is currently, the Only CT Provider of this cutting-edge diagnostic tool!**

Autism affects 1 in 36 children, yet most are not diagnosed until age 4 or older. EarliPoint™ changes that by using advanced screening methods to assess Autism in children as young as 16 to 30 months. Early and accurate identification enables timely intervention, helping children grow, connect, and succeed—making a profound and lasting difference for them and their families.

### Steps to Diagnosis

1. Begins with a detailed conversation to gather developmental history, family concerns, and early behaviors.
2. Children watch a series of short video scenes on a tablet while EarliPoint's eye-tracking technology monitors their looking behavior.
3. Licensed clinicians review EarliPoint's objective results alongside clinical observations and developmental history to inform a diagnosis and create personalized intervention plans
