THE LANDSCAPE MANAGEMENT EXPERTS

Superstition Mountain Landscape Update **November 2026**

Our Work in Your Community

- Fall is finally here! Your DLC crew is adjusting irrigation for the cooler weather to help your plants stay healthy all winter long.
- Since some of your turf was overseeded in October, you should be seeing bright green winter Ryegrass by now. After the first mow, we added fertilizer and will keep watering so it grows strong.
- We're still caring for the Bermuda grass as it goes dormant for winter. Crews will occasionally mow and address weeds as needed. It is normal for Bermuda to appear yellow and straw-like during the cooler months.
- As the weather cools, we lower irrigation for established plants and turn off sprinklers in Bermuda areas once they go fully dormant. We adjust again in the event of rainfall to help save water.
- Our crew prunes certain shrubs seasonally, following Sustainable Landscape Management guidelines. We trim most species down to about half their size. Seasonal pruning helps your plants grow longer in their spaces with more colorful blooms in the next growing season.
- We did our sight line inspections in September to locate plants potentially causing a visual obstruction. We routinely review sight lines and do these special checks twice a year.
- Our on-site crew trims low-hanging branches and lifts tree canopies.
- Fall means lots of falling leaves! We use special equipment to collect and remove them quickly as we work through your Community.

Landscaping Tips

The majority of water used in most households goes to the landscape. But, now that the winter months have brought cooler weather, you can reduce your water usage and save some money on your water bill. Here are some tips and tricks for your yard:

- As the weather changes, adjust your watering frequency and run time. Check out the interactive watering guides at wateruseitwisely.com to determine how often and how long the stations on your irrigation controller should run.
- Take advantage of every rainfall! Turn your irrigation controller to "off" or "rain delay" and monitor soil moisture before turning the system back on. You can also test the moisture depth in your soil with a long screwdriver, as it will move easily through moist soil but stop once it hits dry soil.
- Check for leaks within your system.
