

AMPOL Equipment is setting the standard for Disinfection

THE AMPOL PROCESS

AMPOL utilizes self fabricated UV air sanitizers with standard negative air machine HEPA filters that capture 99.97% of particles in the air. The filtered air is then directed through a UV (ultra-light) box to destroy any residual viruses. Our UV Air Sanitizers are germicidal ultraviolet fixtures that effectively destroy airborne microbes including bacteria, mold, and virus in enclosed occupied spaces . This new industry ability is setting the standard for facility disinfection.
