

NAOMI NEEDS YOU!

Naomi Schwartz is a bright 14-year old girl from Florida who is diagnosed with Aplastic Anemia, a disease in which the body fails to produce blood cells. The doctors have told the family that her only chance to survive is a marrow transplant, from a compatible donor.

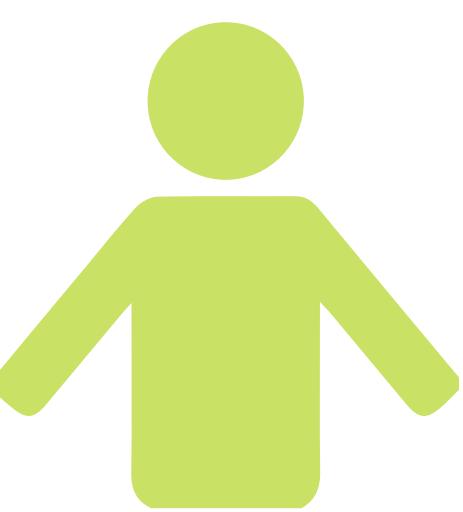

Unfortunately, this teenager who loves music and talking with friends has no match in her family or within the 29 million people in the registries worldwide. As a mixed-race (Hispanic/Jewish), she only has a 15% chance of finding a match. But if you are from 18-44, you can change that with just a cheek swab. There are 15,000 patients like Naomi, searching for their cure. You could be the one! Help us spread awareness and sign-up new donors.

It's more likely to find a match within the same race. Let's make a difference!

DID YOU KNOW?

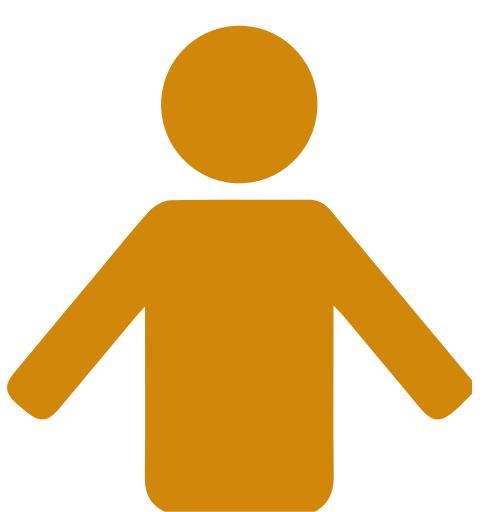

Blood Cancer Patients who are ethnically diverse have a lower chance of finding a match.

78%

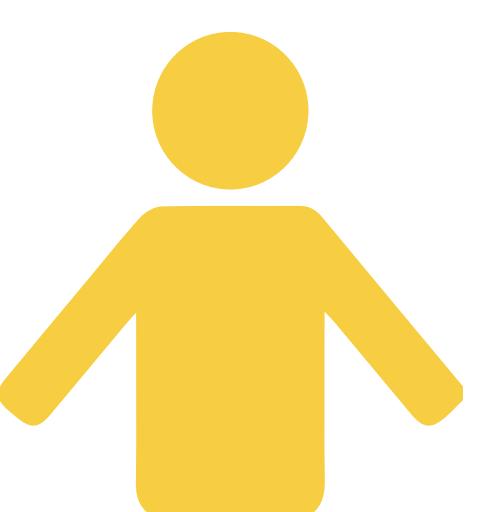

Caucasian

46%

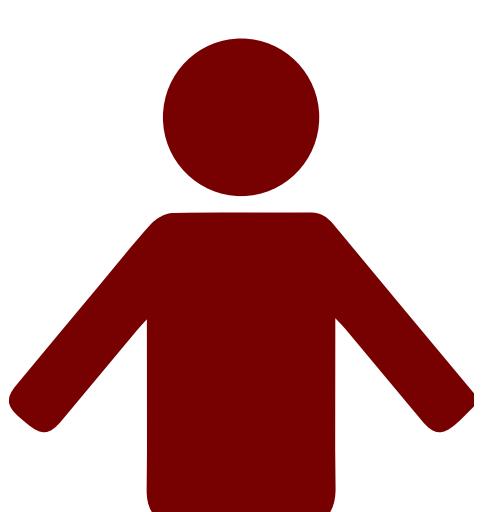

Hispanic

41%
