

Anatomy and Physiology Students Visit Cadaver Lab

KDS DAR High School Anatomy & Physiology classes took a field trip to visit the Gadsden State Community College Cadaver Lab. The students examined specimens of human organs that were healthy and those that exhibited disease processes.

Students saw healthy human specimens discussed in class all year, along with specimens displaying pathology such as blocked arteries in a heart, congestive heart failure, lung cancer due to smoking, smokers lungs, Alzheimer's disease, etc. Students were also taken into the cadaver lab, where they examined a male and female cadaver.

This was a fantastic experience for the KDS High School Anatomy & Physiology students, as many of them are planning to pursue a career in the medical field. This field trip provided them with the opportunity to get a glimpse into future college level Anatomy classes and determine if the medical path was truly for them.
