

## 7.6 Clareity Security Solutions

### SAFEMLS Identity and Access Management

SAFEMLS IAM is an intelligence-based authentication engine. Driven by MLS-defined rule sets, SAFEMLS is a zero foot-print authentication engine with the ability to send an email notification/warning with current Terms of Use, prompt users to change their password, send a one-time password via email, or lock account access. SAFEMLS is a 100% hosted Software as a Service (SaaS) platform.

### SAFEMLS+ RISK User Analytics Module (UAM)

SAFEMLS+ RISK UAM is an intelligence-based monitoring system that tracks user logins (including device identity), operating systems, and geo-location. Based on the gathered data, reports identify account sharing, inappropriate system use, and the required staff compliance action. The service provides robust user behavior analytics, including detailed device information and usage patterns.

### Single Sign-On (SSO) Dashboard

The SAFEMLS platform can be deployed as a Single Sign-On Identity Provider (IdP). The primary benefits of this service include the ability to log in once and access all the integrated applications without needing to reauthenticate, strong security and activity monitoring across multiple applications, single-point authentication control, and a significant reduction in password management complexity and support. The SSO Dashboard integrates with all SAML 2.0 or OpenID Connect Compliant Systems.
