Security Health Plan provides enhanced prescription decision support services for all product lines

As of April 1, Security Health Plan will be utilizing MedImpact's enhanced e-prescribing platform (MedPrescription Insight™) to provide prescribers with member eligibility, medication history and benefit plan information for ALL Security Health Plan members.

This includes Real Time Benefit Check (RTBC) and electronic prior authorization (ePA). RTBC and ePA are electronic prescription decision support tools that are integrated within the prescriber's enabled electronic health record (EHR) and workflow.

Real Time Benefit Check offers patient-specific cost and coverage details, including low-cost therapeutic alternative drugs and preferred alternative pharmacies, to help reduce member/plan costs and improve formulary adherence. Because the patient will know if a medication is covered and the cost before he or she leaves the physician's office, it prevents sticker shock at the pharmacy and reduces the likelihood that the pharmacist will have to call the doctor for approval to fill the prescription or a denial because there are formulary alternatives available.

ePA provides an enhanced platform that processes prior authorization (PA) requests in real time at the point of care to help reduce disruption, lower costs, and improve clinical quality and safety for better member care. Physicians can initiate the PA prospectively within the member's electronic health record (EHR) platform. By cutting down the time it takes for members to receive their medications and providing checks to ensure this is an appropriate treatment, this approach to ePA helps improve adherence and reduce prescription abandonment.

Security is committed to empowering health care providers with cutting edge tools to deliver optimum care, reduce administrative burden and provide a better experience for our providers and members.

Security Health Plan pays for the MedPrescription Insight™ service per transaction and is committed to bringing value-added services to ensure providers have accurate insurance and prior authorization information.
