

On the first day of Fish - mas aquaticresearch gave to us a carbon cartridge to filter debris.

On the first day of Fishmas, aquatic research gave to us:

A carbon cartridge to filter debris

Excellent water quality is important to the health of your zebrafish and subsequently the effectiveness of your research. Aquaneering employs the simplest four-phase filtration process (even in its smallest systems): mechanical, biological, finishing, and sterilization to provide the cleanest recirculated water in the industry. In stand alone systems, carbon filters trap contaminants and impurities from the water in their porous carbon substrate. Larger systems use robust backwashing filters or bag filters that can more effectively clean water flowing in greater quantities and under higher pressure.

Learn more about the Aquaneering filtration process here:
