MYELLEVATE®
by CYNOSURE®

NEW YOU IN NO TIME

What is the MyEllevate procedure?

The MyEllevate treatment is a minimally invasive jawline contouring procedure.

How does it work?

The MyEllevate innovation is exciting because it is simple and easy to perform and a great choice for patients seeking a minimally invasive procedure. It can easily be performed by a MyEllevate surgeon using local anesthesia.

Using the ICLED® light-guided suture system, surgeons can easily place a suture support system without incisions that immediately elevates and approximates underlying structures.

How long does the MyEllevate procedure take to perform?

For most patients, the MyEllevate procedure takes less than one hour to perform. There is generally little, if any, bruising and swelling and most people can return to normal activities in about a week.*

* Excluding heavy lifting

Can the MyEllevate procedure be used in conjunction with other treatments?

Yes, the MyEllevate treatment can be used as a standalone procedure or in conjunction with submental liposuction, chemical lipolysis and energy based skin tightening technologies. We have seen great results on patients who receive the MyEllevate treatment and the Smartlipo® procedure.

What can I expect for results?

The MyEllevate treatment delivers immediate and natural-looking results in most patients that can last for years! The MyEllevate treatment is a great minimally-invasive option to restore your youthful appearance with long-lasting results!

How is the MyEllevate treatment minimally invasive?

Using ICLED® light guidance, MyEllevate surgeons can easily place a suture support system without incisions.

ICLED® is the first and only, patented light guided technology for cosmetic procedures that utilizes the illuminated Suturod® to accurately place sutures through small puncture sites. Most patients experience rapid healing with minor bruising and swelling due to minimal tissue trauma and can quickly return to normal activities.
