

Native Grasslands

California Native Grasslands Association (CNGA) is a botanical and ecological group that studies and helps manage grassland type ecosystems or habitat in California. Historically, grasslands were prevalent in California like prairie lands in the Midwest and Plains states. Grassland areas have declined tremendously overtime due to human activity and climate change. CNGA's website is a well-documented resource and agency in California (cnga.org). The rest of this article comes from their list of resources on their website below.
