

Jan 6, 2025

Apple has released iOS 18.2.1 for iPhone users, and iPadOS 18.2.1 for iPad users. The new software updates are said to include important bug fixes, and are therefore recommended for all users to install.

No published security updates are included in the release, and it's not entirely sure what the specific bug fixes are either.

At the moment, this is the only new software update available for Apple devices, but it's possible bug fix updates will arrive for other devices later.

How to Download & Install iOS 18.2.1 Update

First, backup your iPhone or iPad to iCloud and/or a computer, and then proceed with the installation:

1. Open the "Settings" app on iPhone or iPad
2. Go to "General", and then go to "Software Update"
3. Choose "Update Now" to download and install iOS 18.2.1 or iPadOS 18.2.1 onto your device

Your device will have to restart to finish installation, as usual.

iOS 18.2.1 IPSW Firmware Files

If you prefer to install updates manually using IPSW files, the links below point to Apple CDN servers:
