

The Owls of Philippe Park

A Local Tragedy, A National Issue

Photo by Linda Schocken

Philippe Park in
Safety Harbor,
Florida

This is Oliver, the male with Emily, his mate.
Great Horned Owls mate for life.

Photo by Linda Schocken

Oliver nested in the park for eight years. During this time, he had two mates. Emily being his mate for the last two years before her demise.

Photo by Mark Schocken

Photographers came from all over Florida and numerous states to photograph this owl family. We have friends from the UK that added Safety Harbor to their itinerary to photograph these owls.

What happened to the owls?

- In 2022, Emily hatched three owlets in early January 2022. We called them Huey, Dewy (later identified as Daisy) and Louie.
- Huey died on 3/4/2022, Emily died 3 days later, on 3/7/2022. Both deaths were confirmed to be caused by anticoagulant rodenticides.
- Louie was found dead in what we referred to as The Owl Tree on 4/5/2022.
- Oliver was found dead 3 days later. Results confirmed from rodenticide poisoning.
- There was one, 3-month-old owlet left, Daisy; we tracked her for almost 3 weeks; then she disappeared.

This is one of the last photos we have of Daisy before the day she disappeared.

There could be however, a happy story here. Stay tuned!

The day Emily died we realized that the City of Safety Harbor was using anticoagulant rodenticides on all city properties – suddenly we could see there were black boxes of rat poison everywhere

In less than 24 hours...

- A handful of concerned citizens met each other under the Owl Tree—it was Fateful
- That night we started a Facebook group called Safety Harbor Strong Owls – 500 people joined the group within 3 days (now at over 2,000 members)

DEATH BY POISON

Rat poison is often used in bait stations, those shoebox size black boxes you see around buildings and dumpsters. The rats and mice do not die inside the stations but after eating the bait, they go back into the wild and can take more than a week to die. Weakened from internal bleeding, poisoned rodents become toxic ticking time bombs for any animal who preys on them.

All types of rodent poison can sicken and kill wildlife and pets.

Do Use Safer Products	Don't Use Unsafe Products
Bromethalin Examples: - Fastrac - Assault	Brodifacoum Example: d-Con Bromadiolone Example: Contrac
Cholecalciferol Examples: - Terad3	Chlorophacinone Example: Ratol Difenacoum Example: Di-Kill Rat Bait Difethialone Example: First Strike Diphacinone Example: TomCat

We developed a brochure and posters to help educate the citizens concerning this issue.

Rat Poison Kills More Than Rats!

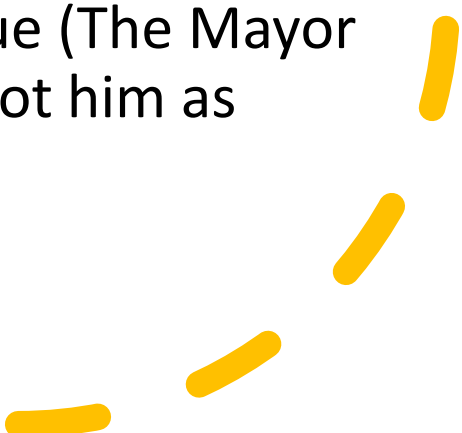

Joe Calomelli

Rat poison kills more than rats! Poisoned rats are weakened and come out of the poison bait boxes (or their burrows, once poisoned) looking for water. When predators such as owls, hawks, foxes, or even cats and dogs eat these poisoned rats, they too can be poisoned.

www.raptorsarethesolution.org

- 
- The City of Safety Harbor mailed our brochures to every resident of the City as a utility bill insert.
 - The Mayor commented on the risks of poisoning wildlife and pets and asked everyone to stop using anticoagulant rodenticides.
 - The issue was the cover of the quarterly Safety Harbor Magazine.
 - The Mayor additionally posted the article on his social media site, which generated over 2,500 “Likes”, and over 250 “shares”, indicating the broad appeal and political support of the issue (The Mayor was astounded, no other issue ever got him as much social media attention).

Beloved Mother Owl, Babies Die From Rat Poison In Safety Harbor Park

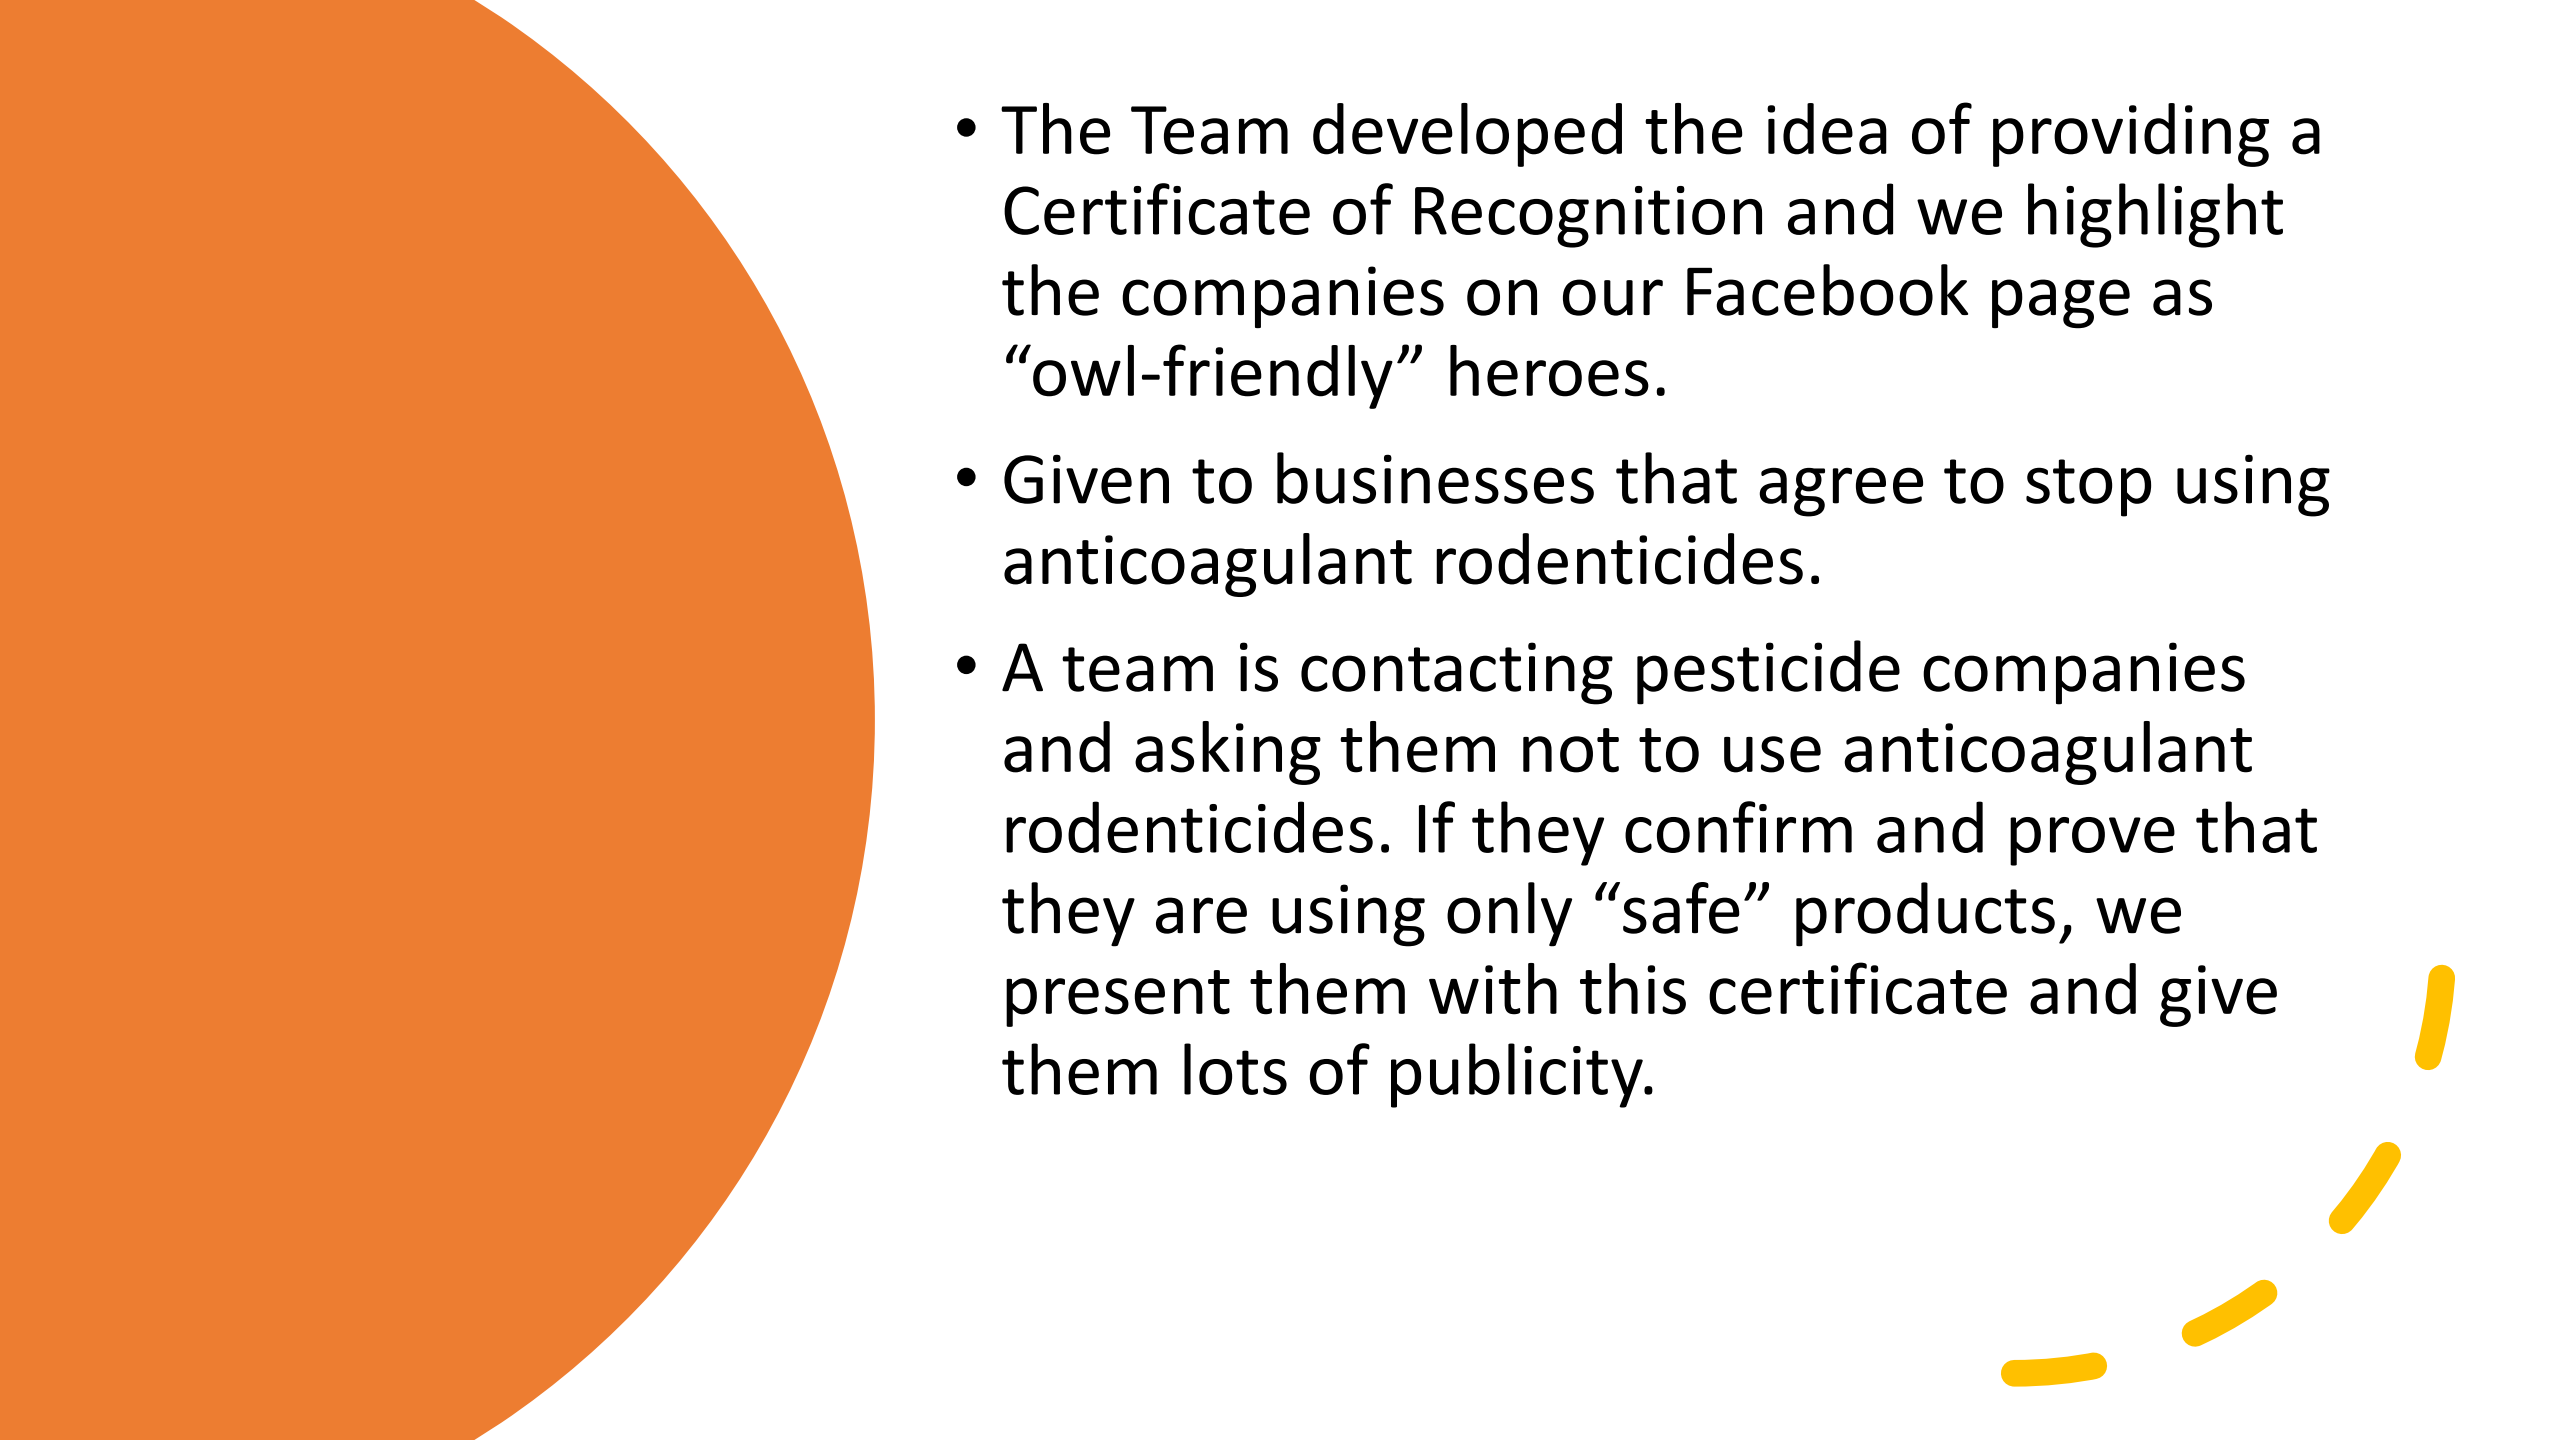

Emily, a great horned owl, and two of her owlets are the unintended victims of pesticides placed around businesses to kill rats.

A close-up photograph of a mother owl and her two young owlets. The mother owl is on the left, looking towards the camera. The two young owlets are on the right, looking towards the camera. They are in a nest made of twigs and leaves.

- 
- The Team developed the idea of providing a Certificate of Recognition and we highlight the companies on our Facebook page as “owl-friendly” heroes.
 - Given to businesses that agree to stop using anticoagulant rodenticides.
 - A team is contacting pesticide companies and asking them not to use anticoagulant rodenticides. If they confirm and prove that they are using only “safe” products, we present them with this certificate and give them lots of publicity.

CERTIFICATE OF RECOGNITION

**THIS CERTIFICATE IS

In memory of Emily and Huey

The Truth About Anticoagulant Rat Poison

Dozens of scientific studies have found rat poisons are present in the tissues of a wide variety of wildlife, including owls. Rat poison also kills dogs and cats. Rat poison leads to a painful death for all animals who are exposed to it, whether they consume the poison directly or eat the flesh of a poisoned animal. Rat poison kills the very wildlife that helps us control rats and mice.

Nature's Pest Control

One adult owl can eat 1,000 to 1,200 rats in one year.

Rats, mice, and other small animals play a critical role in the ecosystem as food for many animals and as seed dispersers for trees and plants.

Using poison to kill rodents has the long-term effect of **INCREASING** the rodent population since the poison kills off the rodents' natural predators, such as owls, allowing the rodents to breed unchecked.

Photo by Mark Schocken

Nature's Pest Control

By using preventative measures and safer rodenticides, we can keep rodents out of our homes and businesses, protect our pets and keep the rodents in the wild where they belong.

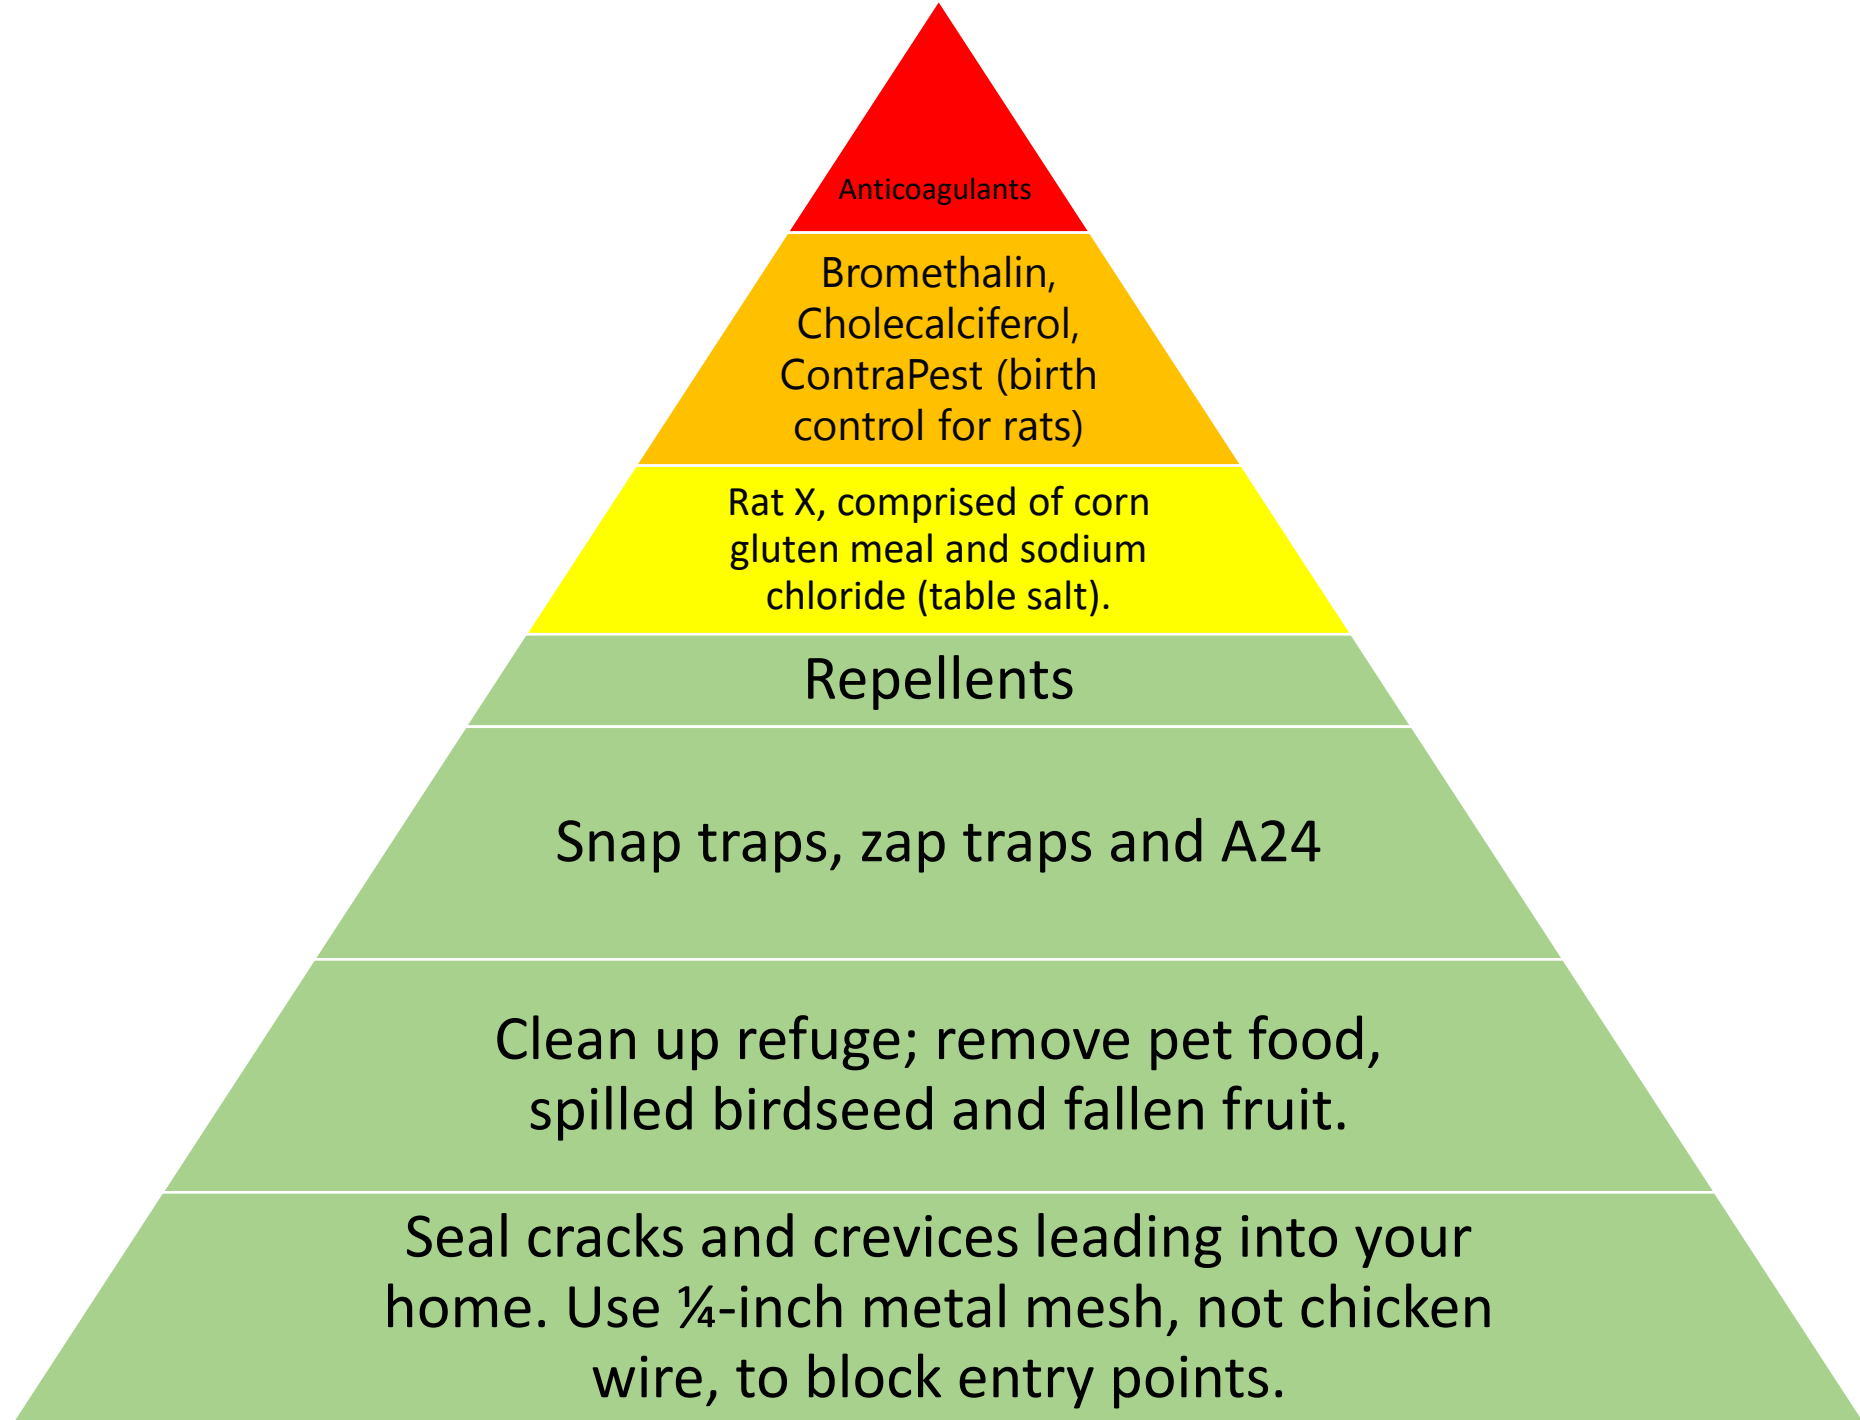

Photo by Linda Schocken

What you can do!

- Keep trash bins tightly closed, clean up refuse; remove pet food, spilled birdseed and fallen fruit
- Seal cracks and crevices leading into your home. Use ¼-inch metal mesh, not chicken wire, to block entry points
- Trim foliage and tree limbs at least 2 feet away from sides and roofs of houses
- Use an owl box; ultrasonic devices, “mouse balls”
- If you need to hire a professional, only hire exterminators who do not use anticoagulant rodenticides and who use and are trained in Integrated Pest Management (IPM). IPM works to permanently exclude rats by rodent proofing your home.
