

Interpreting Construction Drawings and Format of Specifications

Originally built at the request of the Ottawa Construction Association, and now delivered in Toronto, Halifax, and more regions across Canada, over 500 construction professionals, since 2015, attended this easy to understand completely interactive course.

Using a model ICI office 3 storey addition as the sample, we work through all aspects of drawings for the project including architectural, landscape, civil, structural, mechanical, electrical, and plumbing. In Module 4, we build several technical specification sections based on 3-part format specifications and perform a comprehensive review of MasterFormat including Divisions 00 and 01. When delivered on-line, through our VIRTUAL CHALK platform and using adobe pdf annotations, the learner is immersed in a digital environment, as if using sophisticated estimating software.

This course suits anyone who is starting to work with construction drawings and/or specifications in their daily workflow.
