

Changes to Oatey's CPVC Solvent Cements Effective May 1, 2024

Dear Valued Customer,

We trust this message finds you well. We're reaching out to share news about an upgrade to Oatey's CPVC solvent cement product line.

In line with the new Volatile Organic Compound (VOC) standards mandated by South Coast Air Quality Management District (SCAQMD) Rule 1168, Oatey Co. has updated its CPVC solvent cements.

Oatey Co. will begin production of the next generation CPVC solvent cements on May 1, 2024. All cans manufactured from May 1, 2024 onwards will contain the new ultra-low VOC formulas.

This is a rolling change, and all product numbers will remain the same. To assist in identifying updated products, the artwork on the cans has been refreshed to include a new VOC emblem on the top left corner.

These new formulas uphold the same rigorous performance standards as their predecessors, ensuring the strongest solvent welds in the industry. Despite the reduction in VOC levels, the viscosity of Oatey's CPVC cements remains within existing ranges and the formulas continue to meet the performance standards set by ASTM F493.

Please note that, while the last manufacturing date for the existing product line will be April 30, 2024, the sale of cans date-coded before this transition date is permissible until July 1, 2027. You can expect to see new formulas shipping to customers by the week of May 20, 2024.

This change underscores Oatey Co.'s commitment to not only delivering high-quality products but also upholding environmental responsibility.

Along with this announcement, we are providing updated copy, images and documents for all CPVC solvent cement SKUs. Please update the content on your website with the provided assets by July 1, 2024.

We appreciate your continued support and trust in Oatey Co. products. Should you have any queries or need further information, please feel free to reach out to us.
