Drench Mix

MASTERVET

For use in Dairy Cattle

Use Drench Mix as a source of nutrition for cows off feed, in a negative energy balance or with GI disturbances.

- Provides essential vitamins and minerals, as well as microbials to boost the population of rumen microbes and normalize gut function.
- Excellent way to provide nutrition when appetite depression is an issue to get cows back on feed.
- Available in 50 lb bag

FEEDING RECOMMENDATIONS

4.5 lb per feeding mixed with water via an esophageal drench system. For best results drench cow 1-2 times per day for 3 consecutive days or until full feed intakes are achieved.

Drench Mix

LIMITED TIME SPECIAL

$15 off/50 lb bag

Offer valid 4/1/2021 - 5/31/2021
Some exclusions may apply, contact Armor today!

Vet Product Review:

This drench mix has the potential to help cows off-feed, in negative energy balance, or with GI disturbances. The calcium propionate provides a gluconeogenic substrate (glucose or sugar for cells) which gives their body something to use for energy especially when not eating. The calcium salts of fatty acids have been shown in some studies to increase milk production and/or milk fat percentage. The potassium chloride can help in cows with low potassium that are inappetant and decreases their peripheral fat mobilization (helps reverse negative energy balance). Niacin (Vitamin B-3) helps with feed efficiency and in decreasing ketosis. Usually rumen microbes make this on their own in cows, but if they're off feed/having GI issues, this will help. The mineral oil is a good lubricant and can help in omasal impactions. The active dry yeast in this product can decrease SARA (sub acute ruminal acidosis) and potentially increase rumen function by increasing the rumen microbes.
