the power to renew... the power to protect

OUR PRODUCTS

Sanitisers at cost effective prices. We buy bulk so that we can reduce the cost to you. We only supply refill so that it can be used in delivery system which you currently have. All the products are manufactured for us by reputable sources. In short, we have shortened the supply chain.

Applications of sanitisers on an industrious scale made easy, enabling other contractors in our market to come online with these systems utilising the equipment they already have with minor changes. Doing this in a cost-effective way of being key.

Reduced cost on systems already being offered in the market by utilising skills and knowledge in the field on an industrial scale. Improving, amongst others, atomising systems for sanitation and considering the practical needs of our clients. System runs on 12V power, meaning that power outages will not affect the system functioning. Custom design and the utilisation of materials commonly used in the marketplace ensure easy implementation. This will positively empower industries that would otherwise have no work.

Local manufacture of products that were imported. Redesigned to fit our market at half the price of imported units whilst ensuring the opening and closing of doors can be done without using your hands.

01

A dark, semi-transparent background image showing a worker from behind, wearing a blue hard hat and a green high-visibility vest. The worker is holding a long-handled sprayer and spraying a bright yellow liquid onto a paved surface. In the background, there are utility poles with multiple wires and a chain-link fence. The overall scene suggests an industrial or construction setting.

UV Light Sanitiser

Ultraviolet light can be used to kill micro-organisms in a variety of environments, such as in circulating air, in water and on work surfaces. UV disinfection is highly effective for destroying harmful bacteria such as pathogens, viruses and moulds. UV light disinfection happens when ultra-violet (UV) light is emitted in short wavelengths which can destroy the DNA of harmful bacteria, effectively removing their cellular function.

UV disinfection is used in environments such as hospitals, clinics, doctors' rooms, vets' rooms, bedrooms and any buildings where large groups of people are present. Sterile air, for example, prevents the spread of diseases and reduces the risk of infection, both in medical facilities and in the workplace. Technilamp manufactures, supplies and services UV disinfection units and systems for these environments: air, surface and water. For more information about our UV lights for disinfection
