

1

Wild honeybees are now officially endangered in Europe.

For the first time, free-living honeybee populations have been listed as Endangered by the IUCN Red List.

2

Not all honeybees live in hives.

Beyond managed colonies kept by beekeepers, wild honeybees nest freely in trees and natural habitats - forming self-sustaining populations vital to ecosystems.

3

Protecting wild honeybees protects biodiversity.

These independent bees hold unique genetics that strengthen pollinator resilience, supporting Europe's crops, wildflowers, and food security

LET'S TALK ABOUT

Why Wild Honeybees Matter in Europe

The World Bee Project

Protecting Pollinators,
People & the Planet

The World Bee Project is the first initiative of its kind that uses really smart monitoring technology, kind of like robot brains, to watch over bees and their environment. We do this to find ways to help nature and people for a long, long time.
