

TP Industrial Yarns Further Expands Production Capacity in the First Quarter of 2021

Newly added Ring twisters at TP Industrial Yarns

With humble beginnings two decades ago as a yarn distributor, TP Industrial's focus was primarily on commodity yarns – Polyester, Nylon, and the like. Over the years our mission evolved, and in 2015 TP set out to expand our offerings and focus more on value-add services to include yarn testing and converting. Recognizing that production of quality custom converted products requires the ability to perform a range of physical property tests, we invested in a state-of-the-art Quality Lab which enables us to test tensile strength, shrinkage, and abrasion resistance, all in-house. These advancements allowed us to develop our own TITAN HMPE product line, which has been very successful and well received in the market.

The increasing demand for converted High Performance material necessitated ongoing expansion of our production facility to include our most recent and largest investment in Q4 2020. With the addition of Heavy Duty Roblon twisters, Galan and Twistech Ringtwisters, coating lines, and winders, we were able to effectively triple our production capacity.

According to CEO Peter de Bakker, the philosophy behind this investment fits perfectly with our company strategy. "The increased use of high-performance yarn in the market demands expert knowledge, well skilled employees and the finest machinery. Our increased capacity in production and state of the art laboratory allow us to deliver the highest quality yarns engineered to in the best possible way to fit perfectly in the production processes of our clients."
